▪ *Over-motivation to succeed quickly.*

Anyone who takes his job seriously and is intent upon advancement aims to be "the best." It is only natural, therefore, that the young engineer in this situation will find himself very highly motivated. He will not have too much patience. When he does not immediately see a solution to a problem, he may become frustrated and either give it up or continue to butt a stone wall.

Patience is very often required for the solution of complicated problems. We have to learn to allow time for meditation, for the continued mulling over of a problem in our minds (sometimes at a level below awareness). Just as "nothing succeeds like success," so very often lack of progress serves only to block progress.

Reprinted from ELECTRONIC DESIGN • December 9, 1959

■ *Neurotic desire for security.*

Everyone has a natural desire for security. But overconcern with security can be neurotic. Such a person may refuse to take a chance on anything that is new or untried. A young engineer with this attitude is in a severely handicapped position to try to develop new ideas.

Quite often such an attitude is instilled through association with senior company employes who may have had unfortunate experiences many years before. There should be no realistic reason for a young person, starting in an organization—with his entire career ahead of him—to retreat into a foxhole of security.

■ ***Fear of supervisors and distrust of colleagues.***

Another example of an emotional block is when the engineer distrusts those with whom he works and fears those for whom he works. In some few cases, of course, these fears may be based on reality. Perhaps, through improper placement, the individual is "over his head," either technically or because of administrative inexperience. Ordinarily these fears are not related to reality. They are primarily a lack of confidence within the individual or a fear of supervisors generally—or any authority, for that matter.

Whatever their basis, they are a definite deterrent to creative activity.

■ ***Grabbing the first idea that comes to mind.***

This emotional block is a failure on the part of many young engineers to reject a workable solution and to continue to search for a better one. A good rule to follow is always to have more than one solution to a problem. You can easily see that this will help your supervisor. With only one idea to judge, he must say either "yes" or "no." With alternatives, you give him a choice. ■ ■

**Fear of supervisors and distrust of colleagues.**

# Blocks to Creativity

## Part IV
## Advice to Frustrated Creators

**This is the last of a series of articles discussing blocks to creativity.**

THERE is no magic in removing the shackles that bind creative thinking. Essential at all times is a positive attitude, rooted in self-analysis and a desire to improve. The person who has been foiled in a creative problem must begin his new attempt by questioning: What caused the block? How can I remedy it?

Bearing in mind that there are three major

*What caused the block?*

*Sit down and analyze yourself*

blocks to creativity—perceptual, cultural and emotional—the frustrated innovator can assure himself that no matter what their cause, these blocks lie within his own mind.

The perceptual blocks obscure the problem as it really is. They frustrate recognition of the "need area." The cultural blocks, instilled by traditional upbringing in the home, teaching in the school and the pressures of society, restrain imagination, inquisitiveness, boldness. The emotional blocks are irrational fears and anxieties that make us reluctant to take appropriate action on our ideas and beliefs.

### Recognize the Blocks

The first step toward a remedy therefore is to recognize these blocks. Certainly little can be done about personal shortcomings that you do not recognize and that others cannot or will not point out to you.

Sit down and analyze yourself. Think about the blocks to creativity. To which of these do you feel you are prone? If you are honest with yourself, you can isolate the ones that have been hindering your idea output. If you are having genuine difficulty in recognizing them, ask someone close to you who you respect—but do not ask unless you are willing to be open-minded.

Now that the blocks are out in the open, have been recognized for what they are and their effect upon you, take the next step—admit them. Go back to specific problem situations that were not solved because of blocks like these. Review them and decide how you might have acted had it not been for these blocks. Look for problems that were subsequently solved by someone else. What was it they saw that you missed? Question them

*Above all, have confidence*

about it. Try to see how you might have reoriented your thinking or synthesized the facts to yield a different, unblocked view. Next look for new situations or problems where you can attempt solutions with your new "frame of mind."

### Try a Check List

Many engineers have developed for themselves a little check list that they keep in front of them when they are working on problems. Anyone can devise such a check list. Refer to it regularly when you are stumped on a problem. Do not, however, make the mistake of using it as a crutch. First let yourself go. Use your imagination. Use all of your creative faculties.

When you run into a roadblock—when you can go no further—then refer to your check list. Remember, its only function is to help ensure that you are not failing to solve the problem because of blocks within yourself, which are making you either:

(1) Unable to see the problem.
(2) Not able to take a different approach.
(3) Afraid to come to grips with the situation.

Awareness is the key to overcoming creative obstacles. You must be constantly aware of all the different ways in which your thinking and idea output may be blocked.

### Supervisors, Take Note

A word to those who supervise the activities of technical people is not amiss either. Give the innovators a chance! When making an assignment, do not be so overly specific in what you want done that no room is left for imagination on the part of individuals. State the problem in a general manner, ask them how they would go about solving it or what ideas they have about it.

Above all, have confidence. Everyone has within him not only these blocks but also the capacity to rid himself of them. If you think about it this way—that you are not going to become more creative but are going to try to use more of the ability you already have—the task confronting you may not seem so insurmountable after all.

Good luck! ▪ ▪

ACTIVITIES REPORT FORM NO. 3

Groups $E_1$ & $E_2$

B. Exercise in Ideation.

1. Did you ever refuse to compete in some activity because you were afraid of appearing silly? or of failing? For example:

2. Did you ever smoke or drink just to be one of the group even though you didn't really want to?
Under what circumstances?

3. Have you ever bought or worn clothing you didn't really like just because it was in vogue? Or--worn hair styles--or colors--just to be "one of the bunch"? For instance--

4. Did you ever fail to offer a suggestion because you anticipated your superior's disapproval? When? Did you later regret not making the suggestion?

5. Do you feel you miss out on fun because of the fear of trying something new? For example:

6. Should teachers and students be allowed to wear shorts and loose shirts to school in hot humid weather? Why or why not? Would you be willing to be one of the first to initiate such comfortable attire?

7. Would you be more likely to write a letter to the editor or make a complaint or offer a suggestion if you could do it anonymously? Or would you prefer signing your name?

8. What kinds of situations do you often wish you could (or would) partake in but you refuse to because you are afraid of appearing ridiculous? (E.g. -learning to rock 'n roll in public)

9. Did you ever try to appear dumber than you are? Was it for fear of being called a "sissy" or "egghead"? Elucidate--

10. If you could afford a new car but had an old car which was giving you no trouble, would you be inclined to buy a new one just for "looks" and prestige?

C. Questions (Metals Lab I)

Groups $E_1$ & $E_2$

1. Instead of the small animal we cast, can you think of some more interesting or useful articles we could have made in this class by sand casting?

2. If you were in charge of a team of research workers for a large foundry and wanted to develop a new material to replace the sand now used, what characteristics would you list as desirable in the new material?

3. If you were going to make several more of these castings, what changes or improvements would you make in the equipment to be used?

# ACTIVITY INSTRUCTION SHEET 3

Groups $E_1$, $E_2$, and C

Metals Lab I

Foundry work dates from the distant past when man first allowed molten metal to flow into a cavity in a rock to make a chisel or an axe head. Although present-day practice tends to replace metal casting by stamping methods wherever possible, there are still innumerable products which begin in some sort of foundry. The block of an automobile engine, the frame of an electric motor, the guard you see over the wheels of the grinder, and the buffing head in the back of the room are common examples of castings. The exercise planned for today should help you gain a concrete understanding of how a sand mold can be made so that molten metal can be poured into a cavity to reproduce a pattern. You may also be interested in looking up die casting, casting in a permanent mold, or the "lost wax" process.

## PROCEDURE (Two persons work with each flask)

1. Fill the drag (lower) half of your flask with foundry sand, packing firmly but not too hard. Vapors cannot seep through sand packed solidly.

2. "Strike off" excess sand and trowel smooth.

3. Sprinkle parting compound on bottom side of patterns and on troweled sand.

4. Press patterns firmly into sand in positions shown. Tap lightly with putty knife handle until they are half way submerged. Trowel the sand smooth again. Rap lightly to loosen patterns.

5. Sprinkle parting compound on top surface of patterns. Blow off the excess.

6. Place cope half (upper) of flask in place and riddle sand (through screen) onto patterns.

7. Fill flask with sand, packing as before.

8. Strike off excess sand.

9. Make sprue through sand in cope. With finger, taper the hole into a smooth funnel shape.

10. Turn over and carefully lift drag half off. Patterns will stay in cope half.

11. Slightly dampen the sand around the patterns with a small brush. Rap patterns lightly to loosen.

12. Hold the patterns in place with one hand and turn the cope right side up.

13. Allow the patterns to fall straight out.

14. Carefully cut gates in the cope and drag from cavity to sprue hole. (See sketch.) Enlarge the lower end of the sprue so that the mass of metal in the sprue will cool more slowly than that in the cavity. (Otherwise the dinosaur will have a hole in his tummy.)

15. Blow off excess sand; place flask together and bring it to the pouring bench.

16. While casting is freezing, begin clean-up.

17. Remove casting. Put sand back and break up lumps. Put back all tools and equipment and brush off bench top.

18. Break or saw off gate and place excess metal in melting pot.

19. With an old knife and a piece of sandpaper on a stick, clean off flash (excess metal at the parting line.) This may be done at home.

INSTRUCTOR'S GUIDE FOR IMAGINATION PROBLEM, GROUP $E_2$

Week IV, Metals Lab II

State: The problem today is to change a flat, square sheet--

Do: Show pile of sheets of aluminum cut to 4" squares.

State: --into a circular disc with a raised rim.

Do: Show sample disc which has been formed to shape.

State: You all know that operations like this are performed in large manufacturing plants by blanking and drawing on some sort of punch press. Continental Can, for example, punches and shapes can lids in a press with up to six punches and dies moving together. Using a series of these machines, the Mankato plant is able to produce up to five million parts like this in one day.

Do: Show blanked and pressed can lids with scrap remaining.

State: Since we are making only 50 or 60 parts, we certainly cannot use the same methods and machinery as Continental Can Co.

Ask: What ideas do you people have on this problem?

Note: In plain view are items commonly found in an industrial arts shop: aluminum ingots, blocks of various kinds of wood, masonite sheets, and masonite chuck blanks for spinning. A ring and circle shears is in the background. Drill press, spinning lathe, buffers, arbor press, and an assortment of hand tools are visible. Various sizes of pipe including a 6" piece of $3\frac{1}{2}$ I.D. black iron pipe, as well as sheet iron and plate, rod, etc., are in evidence.

State: We could, of course, start by marking all our pieces with a compass and then cutting out circles with a tin snips. How else could this be done?

Do: Record responses if ideas are produced. Discourage any evaluation--this comes later. If no ideas are forthcoming, make some suggestions, as:

Clamp disc in spinning lathe. Make jig for cutting so that all are the same size.
Use a hole cutter in the drill press.
Make a punch and die. Use the arbor press for power to cut discs.
Build on first idea. Make chuck and, after trimming, spin to shape.

Do: After five to seven minutes, stop discussion and state that time does not permit further consideration of these ideas. Hand out Activity Instruction Sheets and point out buffers, arbor press with shaping dies, and demonstrate ring and circle shears.

IMAGINATION PROBLEM - - Week IV - - Fall Pilot Study

Notes Made After the Laboratory Session

After the question, "What ideas do you people have on this problem?" the conversation went about as follows:

Student A: Cut out the discs.

Instr: How? With what?

A: Snips--tin snips.
B: Mark your circles first.
C: Grind them out.
B: Saw them on the band saw.

Instr: (Pointing) We have some equipment around here--drill press, lathe. (Pointing to ring and circle shears) This odd looking piece of apparatus. Does anyone know what it is? (No answer.)

D: Use that to cut the circles. (Chuckles around room.)

Instr: As a matter of face we will. But doesn't the rotation of some of these machines give you an idea?

E: Turn them on the lathe.

Instr: (Holding up a square) You mean to mount this in the lathe so it turns and hold a cutting tool against it?

E: Yes.

Instr: What about some other idea using power rotation?

F: We could use one of these thing-a-ma-jigs that fit in the drill press and has a piece coming out to the side--(Obviously describing a circle cutter.)

Instr: Have you seen an apparatus like this?

F: Yes.

Instr: You mean a circle cutter?

F: Yes.

Instr: Fine. I believe we have demonstrated ability to think along a variety of lines and also that it is possible to perform this operation in several different ways even in a small shop like this. We will use the ring and circle shears to cut the circles.

Instructor then proceeded to demonstrate the operations described on the Activity Instruction Sheet IV. All persons finished easily in the allotted time. Some had forgotten their castings and had to return on the following day to glue them in place.

Note: This period was introduced with a few complimentary remarks on the fine efforts a number of students had made in answering the questions on the previous Activity Report Forms.

IMAGINATION PROBLEM - - WEEK IV - - Winter 12:00 Class

Notes Made After the Laboratory Session

This group was extremely slow in responding. Only one contribution was volunteered:

> Use a pipe with the lower edge sharpened. Lay the aluminum on a block of wood and cut it by hitting the pipe with a mallet or placing it in an arbor press.

IMAGINATION PROBLEM - - Week IV - - Winter 2:00 Class

Notes Made After the Laboratory Session

About a minute was spent in introduction of the problem and explanation that evaluation is being neglected only temporarily and that seemingly stupid ideas may later turn out to be ingenious.

This group seemed to enjoy the process and contributed rather freely. Ideas were recorded as follows:

A: Use a compass--cut out with tin snips.

B: Sharpen a pipe--place disc under it. Have a solid piece which slides into pipe under the disc. Press down on the pipe to cut.

Form desired shape in the solid piece and put something inside pipe which comes down and shapes tray at the same time.

C: Use cutter as on sheet metal rotary machine. Set on solid circular block and make cutter run around it.

Same, except cutter stands still. Material is clamped to block and turns.

(This is exactly the principle of a ring and circle shears. When the student was asked whether he had ever used a ring and circle shears he replied that he had never heard of one. When the machine standing nearby was pointed out to him, he said he had never seen one before.)

D: Use hole saw--or circle cutter in drill press.

E: Use lathe. Mount disc on chuck and rotate it--hold bit against it.

Use lathe. Hold rotating grinder against it.

F: Drill a hole on circumference of circle and saw around it with coping saw or jeweler's saw.

IMAGINATION PROBLEM - - Week IV - - Spring Quarter

Notes Made After the Laboratory Session

Ideas were rather slow in coming. The girls did not respond at all. After class one girl said she had had a couple of ideas but feared to mention them. Then later someone else suggested them.

These contributions were made:

Cut out the circles with a jig saw.
Cut out the circles with a tin snips.
Press them out by using a punch and die.
Grind off corners.
File down.
Turn in lathe.

# INDUSTRIAL ARTS 120

Metals Lab II Group C

## Directions

In addition to the reading assignment under Metal Work in your course outline, you may find it necessary to use an encyclopedia or perhaps some of the books in the library. Look in the area of numbers 621-671 and 745. You will also find some very interesting reading on the shelves under number 608.

Answer the questions on the attached sheets and turn this booklet in at your next class meeting.

ACTIVITIES REPORT FORM NO. 4

Group C

After you have done some outside reading, answer the following questions:

1. List several common articles or parts of articles which are made commercially by use of a punch press.

2. What is a "forging"? How does forging differ from stamping?

3. In a commercial matched punch and die, what is the stripper plate?

4. Name some article which is now made more economically by the use of punch and die mechanisms.

What was the older and more expensive method?

# ACTIVITY INSTRUCTION SHEET 4

Groups $E_1$, $E_2$, and C

Metals Lab II

You may choose a 4" square piece of 20 gauge copper (at 15¢ each) or aluminum (at 5¢ each). Everyone must go through the entire procedure listed below. However, to avoid overcrowding at the ring and circle shears, you may steel wool and buff your metal before cutting it. The following steps are necessary:

1. Cut the square into a 3 1/2" diameter circle on the ring and circle shears.

2. At the arbor press, place the disc between the dies and press into shape.

Arbor Press

3. Steel wool both sides of your metal to remove deep scratches and scale. At one of the buffers, polish first on the coarse, then on the fine wheel. Use care to hold metal as shown to prevent its being thrown out of your hand. Spend no more than 2 minutes at each wheel.

4. Finish sanding the dinosaur you made last week. Its base should be quite flat.

5. Clean the polished disc and the dinosaur with a small rag and some lacquer thinner. Print or scratch your name carefully on the bottom of your tray.

6. Place a couple of drops of epoxy resin (from the pre-mixed can) on the bottom of the dinosaur's feet. Set him in the center of your tray and place in the drying rack. If you get any epoxy on your skin, wash with warm water and soap for several minutes. Some people are allergic to this resin.

When the resin has air hardened, it will be given a heat treatment; you may take it with you next week.

# INDUSTRIAL ARTS 120

Metals Lab II Groups $E_1$ & $E_2$

Ideas arise from previous experience--

The wider and more varied your background of experience, the more chance <u>you</u> have for developing new ideas!

Some of the activities which provide background for ideas are:
reading---
travel---
puzzles---
hobbies---
fine arts---
All of you have some background in each of these areas; all should consciously seek more.

There are a number of techniques which will help you make good use of your background of experience. Pages 1 to 15 of Alex Osborn's pamphlet,

THE GOLD MINE BETWEEN YOUR EARS,

lists some specific methods you can use to increase the fluency of your ideas. Read it. You will find it interesting and stimulating! Incidentally, take good care of the booklet--it will be used again later in this course.

After reading the first part of

THE GOLD MINE BETWEEN YOUR EARS

try the Ideation Exercise, Part B, of this pamphlet. Then proceed to answer the questions on the next page. Turn this booklet in at your next class meeting.

THE GOLD MINE
BETWEEN YOUR BARS
by
ALEX OSBORN

# THE GOLD MINE BETWEEN YOUR EARS

## How to Think up More and More Ideas

by Alex Osborn

### ABOUT THE AUTHOR

Born and brought up in the Bronx section of New York City, Alex Osborn helped to earn his way through college by serving as a construction worker, as a bank messenger and as a hotel clerk.

At 21 he became a police reporter on a metropolitan newspaper. Then he took a job as a salesman, and at the same time taught school three nights a week.

During the following years he served as assistant manager of a small plant, where his duties included product design and factory production, as well as marketing.

In 1919 he joined Bruce Barton in founding the firm of Batten, Barton, Durstine and Osborn, an advertising organization which now employs 1800 people in 14 offices.

In the past 10 years Alex Osborn has gained fame as an authority on creative thinking. His four great books on this subject have run into 26 editions.

He is now devoting nearly all of his time and considerable money to the encouragement of a more creative trend in education. His textbook called *Applied Imagination* is already in use on the campuses of about 300 colleges and universities.

According to Osborn, his success grew out of his discovery of ways to make himself better and better able to think up more and more ideas. His principles and procedures (which take up over 300 pages in his textbook) are outlined in this booklet, for quick and easy reading.

As you will see, the author proves that you have a gold mine between your ears—a mine from which you can dig rich rewards, not only in hard cash, but also in the coin of contentment.

Copyright, Ticonderoga Publishers, a division of Christmas Club, A Corp., 230 Park Ave., New York, N. Y.

Surely you would like to:

. . . make more money by winning promotions.

. . . think up more cash-winning ideas.

. . . become a better parent and spouse.

. . get more FUN out of life!

Are there ways you can help yourself toward those goals?

Yes there *are* — just as there are knacks to pitching a baseball or tossing a horseshoe.

The key in this case is a gift you were born with — your ability to *think up ideas.* And this is an ability which you can utilize much more intelligently if you read this booklet.

**IT USED TO BE** supposed that creative imagination was possessed by only a few geniuses, blessed with higher education. But men like Thomas A. Edison proved otherwise.

He was virtually untutored. He started out as a "butcher boy," selling candy and pop and magazines on trains. But by building up his ability to think up ideas, he earned riches and fame.

Creative imagination is no longer the secret of a few happy, successful men and women. Its mysterious workings have been taken apart so that anybody who wants to can now see how ideas are produced.

**EVERYBODY IS BORN WITH CREATIVE IMAGINATION!**

You were born with it — probably with a greater degree of it than you have ever realized. And you can develop this natural talent of yours. You can make it more and more productive.

**THERE'S NOTHING TO HOLD YOU BACK!**

If you fear that you may be blocked by lack of education, read what a great psychologist has said:

"Students with high intelligence are not the ones who produce the most original ideas. The Quiz Kids are often referred to as geniuses . . . but it is doubtful whether they are also fluent in producing ideas!"

The Human Engineering Laboratories studied the talents of different groups of professional and non-professional people. It was found that mechanics rate well above average in their latent ability to think up ideas.

Dr. Albert Einstein says: "Imagination is more important than knowledge." And it can be more profitable, too. Just look at all of those who have won fortunes with their ideas, regardless of whether they had any diplomas.

## AGE NEED NOT MATTER, EITHER —

It's not always true that younger people think up better ideas than older people.

The most creative period of Oliver Wendell Holmes' life was between the ages of 50 and 75. Both Benjamin Franklin and Thomas Jefferson turned out some of their best ideas when they were in their 80's.

The great writer, Somerset Maugham, now in his 80's, says: "Imagination grows by exercise. Contrary to common belief, it is more powerful in the mature than in the young."

## WOMEN CAN THINK UP IDEAS WITH THE ABLEST OF MEN!

Women may lack the muscles of men; but they are plenty powerful when it comes to inborn imagination.

They often put it to use to make housework easier — like the woman who found that the average housewife walks four miles and spends 25 hours every year just making one bed. She thought up a way to cut the distance to one mile and the time to 16 hours per year. Here's how:

"Start at the head, smooth and tuck in one corner completely, from bottom sheet to bedspread. Move to the foot on the same side, tuck in that corner and work across the footboard. Now move up the opposite side, from bottom corner to top." (Show this to your wife and see if it won't save time for her!)

Then there was the woman, who saved herself a lot of work, *and* made a fortune — by thinking up an easy way to scour toilet bowls.

It's a mop fitted with a replaceable pad, filled with detergent. Swish it around the bowl, flick off the pad, flush it, and the job's done!

## LACK OF EXPERIENCE NEED NOT HOLD YOU BACK

Perhaps you've worked for years on a certain mechanical operation. Or with a special office routine.

Don't think for a minute that this limits your power to think up ideas outside your own field.

History shows that many great ideas came from people who had no special training in the problem involved.

Who worked out the telegraph? Morse — a portrait painter!

Robert Fulton was an artist, too. His invention was the steamboat.

Eli Whitney created the cotton gin. He was a school teacher.

When Alexander Graham Bell started to invent the telephone he had almost no knowledge of electricity.

Many a life was saved in the last war by a shell-fragment detector. It was thought up by an unscientific employee of the New York City transit system!

Yes, you'll be surprised how far-ranging YOUR imagination can become when you limber it up with the help of this booklet.

### LET'S GET STARTED

For the ordinary, everyday driving you don't *have* to *know* what goes on in the engine of your car.

But if you were a racing driver, your success would depend on that engine . . . So you'd surely want to know just how it worked!

### GET A "RACING-DRIVER ATTITUDE" TOWARDS YOUR CREATIVE IMAGINATION!

The human imagination – *your* imagination – can be more powerful than anything that ever roared across the Salt Flats of Utah.

To increase your creative power, the *first* step is to understand how your mental engine works.

Let's over-simplify – let's picture your mind as mainly consisting of three servants – your Loader, your Judge, and your Thinker-Upper.

**LET'S FIRST CONSIDER YOUR LOADER.** He packs your mind by bringing knowledge in through the doors of your eyes, your ears, and your other senses. He stores all this knowledge—especially your experience—in your memory.

**SECOND, THERE'S YOUR JUDGE.** Your Judge *reasons* — he analyzes, compares and makes decisions. He is indispensable to your mental workings.

But when thinking up ideas, you have to watch out for the Judge. Unless kept in his place, he will too often nip your ideas in the bud.

**THIRD, YOUR THINKER-UPPER.** Your Thinker-Upper works on material brought in from the storehouse of your memory, plus the new facts you dig up when tackling a problem.

He puts these materials into one fresh combination after another and thus helps produce good ideas.

The ideas you spark may even go beyond what you have stored up in your mind. That's one reason why your knowledge best serves as a guidepost rather than a hitching post. Here are two examples that make this clear:

A paper manufacturer was stumped by a production bottleneck in the form of a certain machine. His engineers tried and tried to think up ways to remedy this but they failed.

A new employee was assigned to the problem. He had no engineering degree — just some mechanical aptitude. Never before had he done any work on a paper machine . . .

...but that young man thought up changes that made the balky machine produce more — and at less cost. How those engineers did blush!

What's the *second* way to step up your creative power?

## GETTING THE WILL TO WIN!

A racing-car driver might know his engine so well that he could take it apart and put it together again blindfolded. His eyes, his nerves, his reflexes, might be perfect. He might also have a brilliant grasp of the techniques of driving a race.

But all that wouldn't add up to a hill of beans unless he had THE WILL TO WIN.

Any realistic, sensible person will put as much *effort* into an endeavor as the *reward* he or she hopes to reap from it.

How much *effort* should you apply?

Well, just take a look at the enormous showcase of rich rewards that are waiting to be won by ideas!

How much effort is your promotion worth? How much driving-force and will-power would an extra cash income be worth to you?

E. M. Statler founded the nation-wide hotel chain which bears his name. He was thought of by outsiders as a *genius*. But his private secretary told me: "I know that every one of his great ideas came from sweating and sweating hard."

Because a man named Lester Pfister kept slugging away at an idea for years, America now has a finer, fuller corn crop. He got the idea of inbreeding stalks of corn in order to kill off weaker strains and build up a hardier species.

He started with 50,000 stalks.

Five years later, he had only four ears of corn left — out of the original 50,000.

But he also had a fortune. Those four ears of corn, untouched by disease after five generations, were the source of seeds for which farmers ever since have gladly paid a premium!

You may never get going on as long a pull as Lester Pfister's. But just remember this advice of a great rowing coach:

> "If you hang on two strokes longer than your opponents, you will lick 'em!"

Hanging on a little longer with creative effort can often turn a brassy idea into gold.

## SQUARE OFF WITH THE PROBLEM

Did you ever hear about the lucky plumber who dropped a piece of steel pipe into a batch of molten glass — and found a way to make glass tubing?

That's the story-book way of solving a problem — by accident.

The surer way is to pick a problem just like you pick a target when you're out hunting.

Draw a bead by stating your problem in its simplest term. Here's an example — the case history of the multi-million-dollar idea called "Sanforizing."

Manufacturers had trouble giving customers as good a fit in shirts as in collars. Collars were washed after being made. But if the shirts were washed, they would lose some of their attractive finish — would look like they weren't quite new.

The problem, Sanford Cluett decided, was to find a way to shrink cloth without putting it in water!

At the cotton mills he studied the finishing process. He saw that the cloth — in strips as long as 14 miles — was being *pulled* through the various processes. Naturally, this pulling distorted the fabric.

Cluett found that if that distortion were taken out, nearly all of the shrinkage would be overcome. So he designed a machine which automatically restored the cloth to balance — in other words, pushed the stretch back in place!

What has a clearly-stated problem got to do with the price of bacon? Plenty, according to the U. S. Department of Agriculture.

A man with a lively creative imagination noted that baby pigs were often crushed by their mothers rolling over on them. So he asked whether this couldn't be stopped by simply tilting the floor in the farrowing house.

Yes, it could. Since mama pigs like to lie with their backs uphill, and piglets like to travel downhill, the tilted floor tends to keep the baby from under the old lady. The Department of Agriculture says that these tilted floors have cut this cause of pig mortality as much as 25%

Once you've got your problem narrowed down, pointed up, and stated, you can then start flying with your imaginative wings.

### TRY EVERYTHING!

When Edison was looking for a filament for his first lamp, he tried 6000 varieties of plants before he found the right fibre.

"Try everything," Edison said, "even Limburger cheese!"

When you look at your problem from every angle, you buckle on one of the sharpest sets of spurs in the thinking-up process. This is the gift which you and everybody else possesses. It is called:

### ASSOCIATION OF IDEAS

Whenever you say, "That reminds me of something," you're using association of ideas. One thought leads to another, like a string of popping firecrackers.

**LET YOURSELF GO!** You certainly couldn't walk very far if you kept "both feet on the ground." But the Judge in your mind tends to scoff: "No, that won't work" . . . "That doesn't sound very good" . . . "That's just plain foolish!"

Send your Judge back into his chambers whenever you set out to think up ideas. When you let him prematurely throw ice water on the wings of your imagination you just can't soar as high and wide as you should.

*Later* you can call in the Judge to evaluate your ideas with all his judicial might.

After you've got the problem narrowed down, you will want to attack it with a barrage of ideas.

## TAKE NOTES AND USE CHECK-LISTS

In each of these ways you can gather fuel and can accelerate your power of association of ideas.

Clement Kieffer is in charge of window displays for a big store. He's won more cash awards, more medals and cups, than anybody in that competitive field. He has 33 windows to fill every week. So he thinks up at least one new idea every day of the month. For his "check list" he uses a big box into which he has tossed 3000 idea-starters — clippings from papers and magazines, notes and sketches of his own.

## CARRY A PAD AND PENCIL WHEREVER YOU GO

Millions of dollars worth of valuable ideas have been lost because of the want of a stub pencil and a scrap of paper!

Keep your notes. Put them in a cigar box, or in your bureau drawer.

Maybe they may lead to nothing at the time you make them. But it may amaze you how you can pull out a note — a week, or a month, later — and find that your imagination has been chewing on a problem and has found a key to its solution.

**SET A DEADLINE!** The need for meeting deadlines has turned many an average newsman into an ace reporter. How? By showing him that he *can* work under pressure — by showing him that he *can* produce with the clock ticking away at his ears!

The founder of one of America's biggest fortunes started work as an apprentice in a railroad shop .One day he was asked if he could fix a locomotive in two hours.

"Yes," he said.

And he did.

Here's what he said afterwards:

> "If I hadn't *promised* to fix that locomotive in two hours, I wouldn't have made it — I wouldn't have put in so much mental sweat."

The need to succeed — the fear of failure — can be a powerful prod to your imagination!

Another way to step up your imagination is this:

**SET YOURSELF A QUOTA!**

Bind yourself to think up a minimum number of ideas within a certain time. Start with one idea a day. Soon you'll find you can take on bigger and bigger stints.

To get the best and brightest results try this:

## MAKE DATES WITH YOURSELF!

Set certain times for thinking up ideas.

Early in the morning is usually the best, for then your mind is freshest. But it's also a good practice to keep a pad and pencil beside your bed.

By conceiving the idea of landing mats which could be made into airfields overnight, Walter Irving did much to enable our armed forces to win out in the invasion of North Africa. What does Mr. Irving say about the time and the place for thinking up ideas?

"The bed, the bedside pad and pencil," says Walter Irving, "are great aids to thinking up ideas. Only last night, I scrawled over four sheets of paper in the pitch dark — notes that could be solutions to a current problem.

"A few months ago in a Washington hotel I awakened from a dream about 2:30 A.M. Then and there I sketched a simple idea that has since started an important new product. Had I just turned over and gone to sleep, I am sure I never would have thought of it again."

And now we come to a series of machine-guns with which you can pepper your problems—machine-guns in the form of QUESTIONS.

## QUIZ YOURSELF

Questions are great unlockers of ideas — especially ideas that are valuable in industry. Questions like these:

## IN WHAT NEW WAY COULD THIS PRODUCT BE USED?

Production of Neoprene has been built into great volume through a steady stream of new-use ideas.

A toymaker makes a chocolate-flavored bone out of Neoprene for dogs to chew on!

A doll-maker covers some of his dolls with a skin of Neoprene — so natural-looking that a child thinks it is a real baby!

The list is endless.

Take Nylon. Because of a "wild" new-use idea, this is now taking the place of catgut on most tennis rackets. It is also being used for fishing lines — and fishing rods — as well as for clothes-lines and 1000 other purposes which were unthought of when Dr. Charles Stine first started to create this new material.

In the steel industry, slag used to be costly waste. Now it is used for ballast in railroad beds, for making cement, for processing into building blocks.

L. A. Conley, a rubber company employee, saw pieces of surgical tubing being thrown into the waste barrel. "Why not cut them into rubber bands of the size and width which are used by the millions to hold small items together?" he asked.

L. A. Conley got a fat check for that new-use idea of his.

## TO WHAT OTHER USES COULD THIS BE PUT?

A well-known scouring pad got its start in the kitchen sink. And then somebody thought up the idea of using it to clean white sidewall tires. Result — a great new market in the twelve and a half million cars with white sidewalls!

Could a telephone have a new use? Sure — transcribed records that announce correct time and latest weather reports have brought millions of extra revenue to telephone companies.

A rat-poison that is successful because it kills rats in a *different way*. For some reason, rats like to lick their feet. This poison is sprinkled where the rats walk, Then — when they lick their feet — they seal their doom.

## WHY NOT ADAPT OR BORROW?

Here are four samples of questions along that line — questions which could help to flush your ideas:

What else is *like* this?
What ideas does *it* suggest?
Does the *past* offer a *parallel?*
What could I copy *outright?*

This design of the new glassdomed railroad cars was probably borrowed from taxicabs with "sky tops." That's how an idea can be *adapted*. If you reborrow the same idea and turn it upside down, you get glass-bottom boats for under-water sight-seeing.

We can even borrow ideas from Mother Nature — as did the Jap who found that pearls grow because oysters become uncomfortable when sand gets in their shells. So he made sure they were uncomfortable — by *sticking* sand

in their shells. And thus he found a way to produce oodles of natural pearls at low cost and high profit.

## HOW ABOUT A NEW TWIST?

Personalized pretzels bent to form your initials? That might sound silly — unless you remember that the sky's the limit when you're piling up possible solutions to a problem.

Here are some questions that could help you think of new twists:

What new *look* could this be given?
What could color do?
How about another form or another shape?

Remember the story of the hardware dealer with a stock of shovels he just couldn't sell? He painted red stripes on the bottoms. This attracted attention — gave the shovels a *different* look — and he sold them out!

*How about another form?*

It wasn't so long ago that all soap came in bars — then somebody suggested that it be flaked.

How about other *shapes?* How about *odor?* How about *motion?* We now have Christmas-tree lights which not only shine colorfully, but also bubble with lively movement.

Some stores put odor to work by spraying perfume in the air outside their stores to attract customers!

## HOW CAN WE SUBSTITUTE THIS FOR THAT?

What other part instead of *this?*

Driving-gears show the value of such questions. Transmission was improved on trucks by substituting metal worms for conventional cogs.

"Why not use a fluid instead of metal gears on automobiles?"

That may have sounded crazy. And yet that was what has made our newest cars so easy to drive!

What other *ingredient?*

"Could we put *glue* in a cleaning compound?" That was the secret of the fabulous success of two Milwaukee men who were paid a fortune for their new product when bought by a great soap company!

**MORE-SO . . . AND LESS-SO?**

How about a "more-so"?

Westclox went for that idea 20 years ago when Big Ben was given *two* alarms — one a shout, the other a whisper. Now Westclox has added a blinking beam which calls you silently. But if you ignore that kindly light, the bell starts ringing angrily.

**HOW ABOUT A BIGGER PACKAGE?** A rubber factory formerly had its rubber-cement packed in one-gallon tins — used once and thrown away. Then an employee suggested that the cement be put in 50-gallon drums. With each operator using a refillable can, oodles of waste and tons of tin were thus saved.

That employee was rewarded royally for his big-package idea!

No longer do you have to bail out your motorboat. Drop a little attachment in the bottom and let your outboard motor do it for you.

## LET'S GO

Up to now, lots of new ideas — lots of successful new products — have probably seemed to you like "strokes of genius" or "pure luck."

But now you see how many of them can be traced back to ordinary people who asked their minds question after question — until their imaginations sparked and handed them answers worth their weight in gold.

## WHY CAN'T YOU DO IT?

Why can't *you* think up more ways to win the rewards that await you — quicker promotion, more money, more happiness, more fun out of life?

You were born with imagination. Neither your age, nor your experience, nor your education is any excuse for your not trying to make more profitable use of your creative talent. It is the greatest gift you possess — the gift that can do *most* to help you get ahead and to brighten your life in every way.

## HOW ABOUT STARTING NOW?

***Books by Alex Osborn***

HOW TO THINK UP (McGraw-Hill 1942)
YOUR CREATIVE POWER (Scribners 1948)
WAKE UP YOUR MIND (Scribners 1952)
APPLIED IMAGINATION (Scribners 1953)

ACTIVITIES REPORT FORM NO. 4

Groups $E_1$ & $E_2$

B. Exercise in Ideation:

Carry a check list and keep your eyes open during the next few days.

Then--before your next class meeting--answer the following questions:

1. What inefficient or awkward actions have you noticed?

Think of the time and effort saved by making one corner of a bed completely before going on to the next. How could you--or someone you observed--save time and effort?

2. In the October 1, 1961, issue of THIS WEEK Magazine, Dexter M. Keezer listed a number of things people wanted invented--such as dwarf grass or grass that grows sideways, aluminum foil that will burn, expandable clothes for growing children, and so on. Crazy ideas? Impossible? What were the first reactions to thoughts of building radios? airplanes? of taking a trip to the moon?

What would YOU like to have somebody invent?

C. Questions (Metals Lab II) Groups $E_1$ & $E_2$

List several articles or parts of articles made in some other way which could be made just as strong and serviceable by a stamping process:

| Article (or part) | How made now? | Advantage or Disadvantage of producing by stamping |
|---|---|---|
| | | |
| | | |
| | | |
| | | |
| | | |
| | | |
| | | |
| | | |
| | | |
| | | |

If you were helping plan a new course outline for Industrial Arts 120, what would you suggest for "different" projects in metal stamping? Show by sketch if possible.

# ACTIVITY INSTRUCTION SHEET 4

Groups $E_1$, $E_2$, and C

Metals Lab II

You may choose a 4" square piece of 20 gauge copper (at 15¢ each) or aluminum (at 5¢ each). Everyone must go through the entire procedure listed below. However, to avoid overcrowding at the ring and circle shears, you may steel wool and buff your metal before cutting it. The following steps are necessary:

1. Cut the square into a 3 1/2" diameter circle on the ring and circle shears.

2. At the arbor press, place the disc between the dies and press into shape.

3. Steel wool both sides of your metal to remove deep scratches and scale. At one of the buffers, polish first on the coarse, then on the fine wheel. Use care to hold metal as shown to prevent its being thrown out of your hand. Spend no more than 2 minutes at each wheel.

4. Finish sanding the dinosaur you made last week. Its base should be quite flat.

5. Clean the polished disc and the dinosaur with a small rag and some lacquer thinner. Print or scratch your name carefully on the bottom of your tray.

6. Place a couple of drops of epoxy resin (from the pre-mixed can) on the bottom of the dinosaur's feet. Set him in the center of your tray and place in the drying rack. If you get any epoxy on your skin, wash with warm water and soap for several minutes. Some people are allergic to this resin.

When the resin has air hardened, it will be given a heat treatment; you may take it with you next week.

INSTRUCTOR'S GUIDE FOR IMAGINATION PROBLEM, GROUP $E_2$

Week V, Woods Lab I

1. Show laminated pencil rack. Explain this will be the wood project. Call attention to the laminations.

2. Ask for ideas on how laminations may be held together while the glue dries. State that shape or size need not be exactly like this.

3. Use flip charts (or slides or overhead projector) to show one or two ideas. Ask again: how else might these have been held tightly together in a curved form?

   (Note: If anyone criticizes anyone else's ideas, firmly remind the class that criticisms may be only constructive. Build on the idea or start on a different tangent. Do <u>not</u> pass judgment.)

   Imagination Problem: (Look at laminated pencil rack.) How could these laminations have been held while the glue dried? Shape or size doesn't have to be exactly like this.

   <u>Possible solutions</u>

   a. Bend a piece of heavy iron and use a series of "C" clamps.

   b. Wrap around a large pipe. Tie with a string.

   c. Same as <u>b</u>, but substitute for a pipe: kettle, log for the fireplace (bark removed), column on drill press, electric motor housing.

d. Place in a bowl and put a heavy weight on top.

e. Make a wood pattern and a number of aluminum castings. Place glued laminations between castings. Press together with arbor press and flip catch.

4. Record ideas on blackboard--or ask student to sketch his idea. Encourage other students to "build on" or revise or simplify.

5. Show more ideas if they have not been already mentioned by students. (See "Possible solutions" sheet.)

6. After six or eight minutes, cut off discussion and show jig made for this class.

7. Continue as in Groups C and $E_1$.

IMAGINATION PROBLEM - - Week V - - Fall Pilot Study

Notes Made After the Laboratory Session

These suggestions were made by students before the showing of the flip charts:

Make form of wood.
Make form of iron or plastic or rock--(after a couple of seconds) or CEMENT!*
Make second form to fit over it; clamp them together and saw both of them at once.

Hold laminations to form with strap of tin.
Tack down with pins.

Cut slot in wood--shape desired--and then push into slot.

Wrap around pipe--hold with string. Make several or many on one pipe.

Push inside pipe. Hold with smaller pipe or wedge in place.

At this point instructor stopped the discussion and showed the sketches of ideas he had prepared to use in keeping the discussion alive. With this group, ideas flowed so rapidly that there was no time to use these sketches. It was also noted that this type of activity is similar to that used in industries where brainstorming is used in developing new ideas. The class was told that the next steps would logically be (1) a delay to allow ideas to incubate, (2) a critical review of all the ideas, and (3) a selection of the best two or three. (This is evaluation.)

*Comment by instructor here: "Note how an apparently stupid idea can lead to a good idea, as stone (impossible) to cement (good--can be molded to desired shape).

IMAGINATION PROBLEM - - Week V - - Winter 12:00 Class

Notes Made After the Laboratory Session

The following ideas were volunteered by students during the course of the discussion:

Use pressure--shape pieces and press together. (When asked by the instructor, this student said he had seen this method used.)

Use weights for pressure.

Make pieces long and nail down the ends.

Use a device like a ring compressor.

The response of this group was very poor. It was seemingly impossible to stimulate many in the class to present ideas freely and without inhibition.

IMAGINATION PROBLEM - - Week V - - Winter 2:00 Class

Notes Made After the Laboratory Session

Conversation and activity diverged from plan about as follows:

Student A, explaining an idea and unable to make himself clear, accepted an invitation to step to the blackboard. Speaking as he sketched, he said:

Form a block of wood like this:

Cover with stainless

Place laminations in here

And another piece of stainless over the outside

Clamp down with bolts here

Instr: Good idea. Have you perhaps seen this used?

A: Yes.

Instr: There must be other ways of doing this job.

B: Use a quart can. Have holes in ends of laminations. Tie around can. Use a gallon can.

A: Place in something hollow and put weights on it.

C: Use steam pressure.

Instr: (Showing flip charts) These ideas closely parallel the ones I had. Notice the similarities. This idea--aluminum castings--is a little different.

The demonstration and regular lab work then followed.

IMAGINATION PROBLEM - - Week V - - Spring Quarter

Notes Made After the Laboratory Session

Ideas from students before flip charts were shown:

Use two pieces of wood; clamp together.

Add length to above and use bolts to hold together.

Bend two pieces of iron. Clamp between.

Tie them together.

Use iron pieces with heaters and special quick-setting glue. Apply glue; clamp together (glue sets immediately); take apart. Start over again.

Bend; clamp across ends and in middle. (Response from girl.)

Very good response. Many <u>different</u> students responded, including the first girl to make a suggestion in any class.

# INDUSTRIAL ARTS 120

Woods Lab I Group C

## Directions

Refer to your class notes and the reading assignment listed in your course outline; then answer the questions on the attached sheets.

Turn this booklet in at your next class meeting.

# ACTIVITIES REPORT FORM NO. 5

Group C

Answer the following questions:

1. How is wood cut into thin sheets for laminations such as we used?

2. What is meant by rotary sliced veneer?

   flat sliced?

   quarter sliced?

3. What difficulties did you encounter or notice in gluing the laminations together?

4. What type of glue did we use?

5. What type of glue is used in large scale production of laminations?

6. List some articles made at least partly of laminated wood.

# ACTIVITY INSTRUCTION SHEET 5

Groups $E_1$, $E_2$, and C

Woods Lab I

Laminated Pencil Rack

Jig No. _____

Introduction: One of the present day trends in the use of wood as a material of industry is the increased production of articles made from laminated wood. Because this material is stronger for a given weight and more versatile than solid wood and because new glues and new machines are available, modern designers are incorporating more laminated parts into their products.

To give you a chance to gain first-hand, concrete experience in the making of wood laminations, a small project has been planned for you. It is hoped, of course, that you will see this as merely a simple example of the multitude of uses which are now being made of laminated wood.

Procedure: Gluing laminations in a jig. At right above, list the number of the jig you are using.

JIG FOR GLUING LAMINATIONS

1. Take four pieces 1/16 x 1 1/4 x 10 3/4, all with a hole punched 3/8" from one end.

2. Write your name on the piece you decide to use for the outside--lightly, for it must be sanded off later.

3. Thread anchor bolt through clamping strip and holes in veneer strips; tighten with fingers. Clip about 3/16" off the inside piece and about 1/8" off the two middle pieces with a tin snips or shears.

4. Place a strip of paper towel on each side of the laminations to prevent getting glue on the jig.

5. Spread glue between the wood pieces, being careful not to miss any spots. Do not use an excess of glue.

6. Straighten the laminations and tighten the anchor bolt with a screw driver.

7. Bring clamping bolt around and slide in slot in base. Tighten nut securely so that no air spaces show between wood pieces.

8. Wipe off excess glue. Place jig in box to dry. Replace cap on glue bottle.

Procedure for preparing the base. List your jig number here:_____

1. Secure a base piece and place it in jig.

2. Mark a 5/16" twist drill with a piece of masking tape as a guide in drilling the holes in the base 1/4" deep. The jig is made so that the same depth guide is satisfactory for all holes. If someone else used the drill and marked it, be sure it is still correctly marked.

3. Place jig and base piece in a vise and drill all holes.

4. Sand only top side of base piece. Clean out holes as necessary.

JIG FOR DRILLING BASE PIECE

5. Put away all tools and equipment. Brush off bench top.

Check the reading assignment in your course outline.

Read the attached material and work out the "Ideation Exercise."
Answer the questions on the last page.

Hand back the entire booklet at your next class meeting.

ACTIVITIES REPORT FORM NO. 5

Groups $E_1$ & $E_2$

A. Preparation for Creative Thinking.

It is generally agreed that there can be no set fomula for the production of new ideas. This is an unpredictable process which is not well understood. If a set of rules were formulated for ideation, the restriction would probably reduce the quantity and quality of the ideas produced.

There are, however, things a person can do for stimulation and preparation. Just as an athlete warms up before entering a game, a creative person will find ways of "loosening up" in his thinking as he wrestles with a problem. A highly productive ad writer, Alan Ward, has this to say about his "method":

> I have no sure way of uninhibiting myself for creative thinking, but I have found that one good way to get into a working mood is to close my door and try to forget everything but the job before me. Than I pull my typewriter to me, wrap my legs around it, and start to write. I write down every line that comes into my head--crazy, dull, or however it sounds. I find that if I don't, it may linger there and block others. I write as fast as I can. Then, after a long while, some cogs that haven't worked start to whir, and something striking begins to tap itself out on the yellow sheet before me--like a telegraph message. That's the hard way and about the only way I know.[1]

Persons who make a living by the use of their creative talent know that they must force themselves to make a start. A favorite device of melody writers is to sit down at a piano and go to work. They start by picking out any tune which comes to mind, but the secret seems to be

---

1 Quoted in Applied Imagination by Alex F. Osborn, p. 127.

in getting started. No doubt hundreds or thousands of poor tunes are written. When a good one emerges, all failures are forgotten. Clarence Buddington Kelland is reported to have said that he would produce practically nothing unless he forced himself to sit down at his typewriter after breakfast each morning and begin writing--whether he felt in the mood or not.

## Check Lists

While brute force is the primary requisite for idea production, there are devices which are of help in some instances. Many, if not most, of the people who come up with the most imaginative ideas make constant use of a check list of some sort. This means that every good idea is saved. Whether the idea strikes in church, while shaving, or in the middle of the night--it is written down. Homer J. Smith, a nationally known and respected teacher in the field of industrial arts, called his check list a "bill of particulars." He constantly carried a note pad on which he recorded ideas whenever they occurred. He was a fluent writer of magazine articles and books.

## Attribute Listing

A second device which may be useful in attacking certain kinds of problems is analysis, or breaking down into components. For example, if you were asked to invent a better screw driver you might start by listing the attributes of the usual wooden-handled screw driver such as: (1) round, (2) steel shank, (3) wooden handle riveted

thereon, (4) wedge-shaped end for engaging slot, (5) manually operated, (6) torque provided by twisting action. "To devise a better screw driver, we could then focus on each of these attributes separately. For example: The round shank could be changed to a hexagonal shank, so that a wrench could be used to increase the torque; the wooden handle could become a plastic handle, etc. Many variations could thus be thought up in regard to each of the attributes. As a result some major improvements would be possible."[2]

In attempting to invent a new toy for a young child, we might list characteristics which could be expected to interest a child, such as: (1) it can be pulled, (2) it is bright colored, (3) it makes a noise, (4) it moves--in addition to the pulling movement.

## Forced Relationship Technique

By this method the innovator endeavors to combine normally unrelated articles or processes into a new product. Machine manufacturers in the last few years have been producing combination machines which perform sawing, sanding, drilling, turning, and other operations normally performed by individual machines. A manufacturer of office furniture might start his search for a new product by arbitrarily associating any two or more of his present products such as desk and lamp. He would then try to imagine as many novel combinations as he could think of such as a lamp that would recess into the desk at the touch of a button or one what would automatically go

---

2 Suggested by Sidney J. Parnes in Instructor's Manual for Semester Courses in Creative Problem Solving, p. 50

on if a person sat down at the desk when illumination was poor. Later he would evaluate his ideas to see which, if any, were worthy of further consideration.

B. Exercise in Ideation.

Between now and your next class meeting, you are to do some creative thinking. Yes--you.

You may be the kind who can take along a slip of paper and jot down ideas that come to you as you go about your everyday activities. You must then have a watchful eye and an open mind. Whenever you see something that pertains to the problems for this lesson, you will make note of it. Sometime before your next class session, you will merely have to transfer your notes to this sheet, perhaps elaborating a bit on the ideas you have already captured.

Or--you may be a person who has to pour that second cup of coffee or make a Dagwood, wrap your legs around the typewriter or your hand around the pencil, and DIG. Have a pile of scratch paper and just start writing. Think through personal items, clothes, equipment used in your hobbies, furniture, tools, etc. Then hand in your entire list, excluding only those ideas which you think are good enough to have patented.

We have a neighbor who comes over about twice a year with several ideas he thinks would make him a fortune if he patented them. He is a carpenter, and most of his ideas pertain to improvements in tools. Thus far he hasn't got around to it, but who knows when he

will? A cousin knows a family who perfected some lengthening-shortening device on water ski bindings. They now fly around in an airplane bought with a part of the profits--while our cousin is keeping his eyes open for an idea which will buy him an airplane!

Now it may be that you'll have to combine the two methods of thinking--the check list and the sit-down -and-dig procedure. Whichever way you do it, here is what you should come up with:

1. List some articles which illustrate the forced relationship technique. Some simple examples are: a bayonet at the end of a gun, all-season coats with zip-out linings, jack knives with one blade which is a can opener.

2. Now list some combination articles not yet invented--

3. Name some articles which have been improved--possibly by breaking down into components and then improving one attribute of the article. Think how hard it must have been for women to sleep on brush-type rollers--and then somebody solved the sleeping problem by making the rollers of sponge rubber! Squeeze bottles are an improvement over ordinary glass bottles for many liquids, and some bottles of detergent are contrived so one squirt puts the correct amount in the sink. What other common articles have been improved by a change in one (or several) attributes?

4. What articles could be improved by a change in one or more attributes? Look around your garage, your kitchen, your room in the dorm, your basement. Look in your medicine cabinet, your closet, your desk drawer. What are your suggestions?

Confidentially--are you the "check list" type ( )
the "digging" type ( )
or a combination of the two? ( )

C. Questions (Woods Lab I) Groups $E_1$ & $E_2$

1. List or describe as many ways as possible to make thin pieces of wood such as the veneer used in the pencil rack. (Use supplementary sheet if necessary.)

2. What does laminated wood resemble? (Examples: strata in the Grand Canyon, a cinnamon roll.) List many items, unique or common.

3. Some woods make better veneers than others. What qualities (attributes) of the birch made it good for our purposes?

4. What other woods would probably have worked as well?

5. How would you improve the technique we used for gluing the laminations together?

# ACTIVITY INSTRUCTION SHEET 5

Groups $E_1$, $E_2$, and C

Woods Lab I

Laminated Pencil Rack

Jig No. _____

Introduction: One of the present day trends in the use of wood as a material of industry is the increased production of articles made from laminated wood. Because this material is stronger for a given weight and more versatile than solid wood and because new glues and new machines are available, modern designers are incorporating more laminated parts into their products.

To give you a chance to gain first-hand, concrete experience in the making of wood laminations, a small project has been planned for you. It is hoped, of course, that you will see this as merely a simple example of the multitude of uses which are now being made of laminated wood.

Procedure: Gluing laminations in a jig. At right above, list the number of the jig you are using.

JIG FOR GLUING LAMINATIONS

1. Take four pieces 1/16 x 1 1/4 x 10 3/4, all with a hole punched 3/8" from one end.

2. Write your name on the piece you decide to use for the outside--lightly, for it must be sanded off later.

3. Thread anchor bolt through clamping strip and holes in veneer strips; tighten with fingers. Clip about 3/16" off the inside piece and about 1/8" off the two middle pieces with a tin snips or shears.

4. Place a strip of paper towel on each side of the laminations to prevent getting glue on the jig.

5. Spread glue between the wood pieces, being careful not to miss any spots. Do not use an excess of glue.

6. Straighten the laminations and tighten the anchor bolt with a screw driver.

7. Bring clamping bolt around and slide in slot in base. Tighten nut securely so that no air spaces show between wood pieces.

8. Wipe off excess glue. Place jig in box to dry. Replace cap on glue bottle.

Procedure for preparing the base. List your jig number here:_____

1. Secure a base piece and place it in jig.

2. Mark a 5/16" twist drill with a piece of masking tape as a guide in drilling the holes in the base 1/4" deep. The jig is made so that the same depth guide is satisfactory for all holes. If someone else used the drill and marked it, be sure it is still correctly marked.

3. Place jig and base piece in a vise and drill all holes.

4. Sand only top side of base piece. Clean out holes as necessary.

JIG FOR DRILLING BASE PIECE

5. Put away all tools and equipment. Brush off bench top.

INSTRUCTOR'S GUIDE FOR IMAGINATION PROBLEM, GROUP $E_2$

Week VI, Woods Lab II

State: The work for today involves fastening the lamination to its base. Do you visualize any difficulties in doing this?

Do: Hold up a sample of the lamination and base completed to the same stage as that of the students.

State: (If no response.) How will you be sure the lamination is exactly centered over the base? Wet glue is slippery.

Do: Pause a few seconds for ideas to develop. If students respond, encourage others to "build on." (Stop any tendency toward destructive criticism!)

State: Allow your imagination free play. Don't discard wild ideas. State them. If, after they are stated they seem too ridiculous, leave them and go on to something else. You will have them out of your system and they may later serve as the starting point for a productive train of thought.

It would, for example, be helpful if you could magnetize these pieces, wouldn't it?

Do: Show flip chart sketch of magnetized pieces.

State: The pieces would then cling tightly together in the correct position. This is obviously absurd--you can't magnetize wood. But does this lead to other ideas?

Do: Pause for reflection. Allow those who wish, to express themselves. After a few seconds, show flip chart of pieces being guided together by a single dowel through the center hole. Encourage students to continue this attack. Two dowel pins are needed; three would be better. The second and third must be put in place after the lamination is down against the base.

Do: Demonstrate by slipping dowel pins in sample pieces. Students will be able to see that this is almost, but not quite, good enough. The pieces will be held in place only loosely, not exactly.

State: It is obviously necessary to do something to make this set-up more rigid. How can we do this?

Do: Allow a minute or so for ideas to jell. Suggest that each person think of his own solution. Then show jig constructed for this purpose.

State: Here are instruction sheets for today's jobs. Take a few minutes to read them; but there is much to do in a short time, so work rapidly and carefully. Let me inspect your sanding before you glue the pieces together.

IMAGINATION PROBLEM - - Week VI - - Fall Pilot Study

Notes Made After the Laboratory Session

A few introductory remarks were made concerning the values of "brainstorming" and also the necessity of refraining from judging ideas until later. It was emphasized that all members of the group must feel free to state all their ideas. Responses made after the first pause:

A: Hold in a clamp.

A: Make a curved piece of wood. Let laminations fit up into it. Place base underneath and press in with a clamp.

B: Bend a piece of iron into a bow the shape of the lamination. Lay the base piece in place and hold.

Instr: (Showing flip charts.) Here are some "wild" ideas.

C: Groove the laminated piece so the base fits into it. (Note new attack.)

D: Groove two pieces of wood lengthwise so the base and top fit into them. Press together.

E: Hold in a vise.

Note: Perhaps some students receive the impression that we are attempting to repudiate the necessity of evaluation. It should be emphasized that evaluation and good judgment are and always will be of primary importance in arriving at a final solution. It is only in the <u>ideation</u> stage that judgment is suspended.

IMAGINATION PROBLEM - - Week VI - - Winter 12:00 Class

Notes Made After the Laboratory Session

Again this group seemed inhibited and slow to react. The ideas mentioned did not show much serious thinking. It seemed as though they feel incompetent to solve this type of problem. These were the suggestions made:

"C" clamp.

Rubber bands.

Use pressure on the sides.

Use the jig from last week. Modify it so nailing can be done.

IMAGINATION PROBLEM - - Week VI - - Winter 2:00 Class

Notes Made After the Laboratory Session

These suggestions were contributed by the students:

Make a jig of wood. Saw out curved pieces to fit inside and outside of laminations. Clamp to base piece with "C" clamp.

Tie with a string.

Make a jig using a "C" clamp across the ends.

At this point the instructor suggested they try a different track.

Make a jig using three "posts" in holes of base as guides in placing the curved piece correctly.

Note: Students today seemed much slower in producing ideas. Perhaps this was because they were thinking of various types of jigs and found it difficult to explain what they were thinking.

IMAGINATION PROBLEM - - Week VI - - Spring Quarter

Notes Made After the Laboratory Session

Ideas presented before the showing of the flip charts.

A: Use a clamp.

Instr: You mean like this? (Making simple sketch on board.)

A: Yes.

B: Pur the clamp the other way--horizontally.

(It is interesting to note at this point that Student B did not simply criticize the idea of Student A for its obvious disadvantage but proceeded directly to a "better" solution.)

C: Use rubber bands. Both ways.

D: Notch laminated pieces to receive base. (Note grasp of problem caused by fact that glue makes wood slippery.)

Students were shown the flip chart of the "magnetized" pieces.

E: Use a quick-drying glue.

Instr: Any other ideas?

F: Use contact cement.

The group did not seem particularly reticent, but seemed to have difficulty producing ideas. Perhaps the problem for this week is more difficult than some of the others.

# INDUSTRIAL ARTS 120

Woods Lab II

Group C

## Directions

After reading the assignment in your course outline, refer to your lecture notes and--if necessary--to a text on woodwork in the library. Other sources of information include catalogs, hardware stores, and lumber yards. Then answer the questions. Do not guess.

Turn in this booklet at your next class meeting.

# ACTIVITIES REPORT FORM NO. 6

Group C

1. Name and describe briefly three types of clamps commonly used by woodworkers:

   a.

   b.

   c.

2. Name and describe briefly the properties of three different kinds of glue used in large quantities by woodworkers.

   a.

   b.

   c.

3. List and describe or sketch eight or ten of the more common types of fasteners (common nails, oval head screws, etc.) used by woodworkers.

4. Describe the two kinds of sandpaper commonly used in hand woodwork. Give color, hardness, cost, etc.

# ACTIVITY INSTRUCTION SHEET 6

Woods Lab II

Groups $E_1$, $E_2$ and C

Introduction: In factory assembly of wood products, two methods are in common use. In some cases the individual pieces are cut to shape and drilled in such a manner that they fit together in only one position. The workmen may then quickly assemble the pieces in the correct order. In other cases, especially when large quantities of an object are being produced and the pieces do not naturally fit into their correct positions, various types of jigs are used to hold the parts in place while they are being fastened and while the glue dries. As a simple illustration of the second type of procedure, a jig has been made for holding the parts of your pencil rack while they are being nailed together.

JIG FOR ASSEMBLING PENCIL RACK

Assembly procedure:

1. Sand inside surface of laminated piece.

2. Place this piece into assembly jig and hold the jig shut with a "C" clamp. Drill through the five 5/16" guide holes.

3. Spread a single drop of glue on each end of base piece. Carefully fit a thickness of paper towel around each end of the base piece to prevent getting glue on jig. Fit into place and hold with a vise. Do not allow paper to get into joint.

4. Start two 3/4" No. 18 brads into each end. Space about 5/16" from edges. You may find a pair of pliers helpful in holding the brads while starting them.

5. Remove pencil rack from jig and finish driving brads all the way in. Use a nail set to drive the heads of the brads below surface of wood.

6. Carefully remove all glue from jig with a damp paper towel.

7. Fill nail holes and any other defects with plastic wood.

8. Saw off ends of lamination with fine-toothed back or hack saw.

9. Wipe or scrape all excess glue from pencil rack.

10. Sand smooth and to desired shape on belt or disc sanders.

11. Smooth inside of holes with rat-tail file and sandpaper on dowel.

12. Finish sanding with fine or 2/0 sandpaper.

OSBORN'S PLAN FOR PANNING
THE GOLDEN IDEAS

BETWEEN YOUR

ACTIVITIES REPORT FORM NO. 6

Groups $E_1$ & $E_2$

A. Brainstorming.

The term brainstorming, coined by Alex Osborn and popularized in books and magazine articles throughout the nation, seems to imply that the brain goes storming through a problem, overcoming all obstacles by brute force. It should, of course, be recognized that brainstorming is not a miraculous technique. There are many problems not susceptible to attack by the brainstorming method. However--when a new idea, a new approach, or a fresh point of view is necessary, brainstorming seems to be more successful than other methods with which it has been compared. For the practical-minded person, perhaps the most impressive evidence of the value of this method is the growing list of large, successful business corporations which make use of brainstorming sessions. Among these are such impressive names as: Aluminum Company of America, Armstrong Cork, Bristol-Meyers, DuPont, General Electric, International Business Machines, RCA, Union Carbide, U.S. Rubber, and United States Steel.

The technique is not new. Everyone has been in a "bull session" where ideas flowed rapidly and freely and where criticism was absent because of the good-humored atmosphere that prevailed. One person's idea was immediately pounced upon by others and enlarged, revised, extended or imitated. Successful brainstorming is

always fun. The hapless individual who is "ridden" by his cronies in the gym, at a party, or on a fishing trip is the victim of a form of brainstorming. Edison used a kind of brainstorming when he tried out thousands of different materials in looking for a light bulb filament. Research scientists use the technique when they try thousands of chemicals in the search for a miracle drug. What is new about brainstorming is the development of definite principles which tend to make the process more efficient. Alex Osborn, in his book Applied Imagination, explains the principles and gives numerous examples of how they work.

Whether you are in a group under competent leadership or alone in the privacy of your own room, you can develop more worthwhile ideas if you observe the following suggestions:

1. Do Not Be Critical. The success of brainstorming depends to a large extent on how well you can separate the mental processes of judging and ideating. Almost all your school training and most likely all your work experience has emphasized the importance of remembering and making good judgments. These are extremely worthy aims and absolutely necessary for the conduct of everyday life. However, it has been found that when judgment and criticism are temporarily deferred, the ideation process is much more efficient. Relieved of the necessity of producing only ideas that will pass the test of criticism, the mind is free to produce a great quantity of ideas. This relaxation is comparable to the mental state of a star athlete during a tight game. He puts out tremendous effort but is not tense. His coordination is perfect and he

makes the most efficient use possible of his muscles. When you are brainstorming, you must adopt an "I-don't-care" attitude. That is, you must say to yourself, "I don't care if this idea is silly--or wild--or if it won't work."

2. Make Use of "Free-Wheeling." It is expected that many or most of the ideas from a brainstorming session will later be discarded. But an idea which at the time seems impractical, foolish, or even ridiculous may start just the train of thought needed to reach a practical solution. Or it may be that the "crazy" idea will not seem impossible at another time or to someone else. Every idea which is new or really different must seem crazy at its onset. For a compilation of wild ideas which later turned out to be worthwhile or profitable, read Fools and Foolishness by Harry C. McKown which is available in the MSC Library.

3. Look for Combinations or Improvements. Another reason for listing every idea you can think of is that many times the impossible idea will work if it changed or modified or improved. In a brainstorming group, the leader constantly encourages individuals to "hitch-hike" on the ideas of others. Often a train of thought is started which leads to a really brilliant or exciting solution. A person working alone can look back over his ideas and quite often follow up some that seem to be promising. This can be done only if ALL ideas are recorded.

4. Work for QUANTITY. In terms of cold statistics--it is evident that the greater the number of ideas from which to pick, the greater the chance there is of getting a really good one. It is also true that in

trying to formulate a great number of ideas, your mind is forced to travel devious and unaccustomed paths. This is an easy way to get your mind to work hard. This is the principle of fluency which is really basic to the process of creativity. Work fast! Don't hesitate! Don't judge!

B. Exercise in Ideation.

To become adept in the use of brainstorming, you must practice. Do the following:

1. You want your father (or guardian or wife) to approve the purchase of a new car. List all the reasons you can think of for buying a new car. Give all your ideas--logical and illogical, reasonable, usual, and unusual.

2. Suppose Mankato State became the University of Southern Minnesota, joined the Big Ten--which thereupon became the Big Eleven --and was to play the University of Minnesota (at Minneapolis) for Homecoming. What could be some Homecoming slogans?

3. Your company has concocted a new candy bar--layers of caramel, nuts, and old fashioned fudge. What suggestions do you have for a name for this new bar?

C. Questions (Woods Lab II) Groups $E_1$ & $E_2$

Spend one hour working conscientiously on this assignment. DO NOT SPEND MORE THAN ONE HOUR ON IT. Force yourself to attempt at least two or three sketches and turn them in no matter how poor--or good--you think they are.

1. Instead of making the pencil rack as we made it, how could it have been made? Sketch 2 or 3 different designs. You will not be graded on neatness or accuracy. Your designs may or may not be improvements--the only requirement is that they be DIFFERENT. With each design lists its advantages, either in use or in construction. (Use additional sheets of paper, as necessary.)

2. You have seen laminated wood used for curved legs on chairs, archery bows, etc. List as many unusual uses for laminated wood as you can. Samples: a curved ruler for measuring around a circle, a form-fitting head support for a person with a broken neck.
   a.
   b.
   c.

INSTRUCTOR'S GUIDE FOR IMAGINATION PROBLEM, GROUP $E_2$

Week VII, Woods Lab III

Lecture to Class: Processing Ideas

In presenting an outline of the creative process, we have until this time passed rather lightly over the process of evaluation. In the final analysis, good judgment is perhaps more important than ideation. If a brainstorming panel comes up with a hundred ideas to improve a product and top management chooses one of the poorer ones, the panel was worthless. It is by no means implied that skillful and critical evaluation is not highly important. The reason for placing so much emphasis on ideation in this class is that most people have had much more training in using good judgment or "common sense" than they have had in thinking up new ideas.

Alex Osborn suggests approximately the following procedure in obtaining the best results from a group of ideas:

1. The culling should be done by a different group than the one which thought up the ideas. If the same people do both, it would be something like a Miss America contest being judged by the mothers of the contestants.

2. The total of all the ideas produced by a group of people on any one day is not the sum total of all the ideas these people could produce. A day or two after a brainstorming session, a list

of all the ideas generated should be passed around with space for persons to enter additional ideas or comments on some of the first ones.

3. The persons doing the screening should look carefully at all the ideas. Sometimes even a silly or foolish idea can be modified or combined to produce the best idea of all. For example, the idea of "hanging copper wire by ropes" made a certain General Electric executive laugh in scorn. However, this idea later led to the method of hanging conduit actually used in many factories. Ropes, of course, were not used; but if the person who first thought of the idea had passed judgment or feared evaluation, he certainly would have remained silent.

4. Put the idea to a practical test. If it is a new name for a product, try it out on a sample of people who make up the potential market. If it is a method of increasing gasoline mileage, try it out in a car on the road. If it is a method of cutting down on assembly time, try it out on an assembly line. If it is a method of feeding a milling machine, try it out on an actual machine.

## Individual Ideation

When an individual works alone, Step 1 of the above processes (culling by a different group) is not always convenient. The best that can then be done is to allow the ideas produced to

"age" for a time before judgment. One can then look upon them with better perspective.

## Problem for Today

We are going to apply lacquer to our projects today by dipping them. Obviously you will not wish to hold the rack in your fingers. On the paper before you, list all the possible methods you can think of for suspending the pencil rack during this operation. The first idea may be to tie a string around it. You can do better than that. O.K., list <u>all</u> the ways you can think of. You have about four minutes.

PAUSE FOUR MINUTES.

Stop! Take this paper along; and, before the next class meeting, add as many more ideas as occur to you. Turn in then with your other work.

Draw a line where you stopped today. Later, circle the idea you think is the best.

IMAGINATION PROBLEM - - Week VII - - Fall Pilot Study

Notes Made After the Laboratory Session

Responses were turned in with the folder for Week VII. The numerator in each fraction represents the number of ideas produced in class. The denominator represents the number of ideas added later.

5/2 3/1 4/2 5/0 4/0 5/7 2/0 4/0 7/0 9 returned

9 not returned

Comment: The discussion of evaluation should, perhaps, have come earlier. A group of three or four men students had begun to withdraw by themselves at about Lab IV. I believe this may have been because they took note only of the "silly" ideas produced and did not catch the significance of fluency during this stage of the thinking. Of eighteen reports returned, nine contained the record of the Imagination Problem; but only four had added ideas after the class.

Woods Lab III

Laminated Pencil Rack - Finishing

Finishing wood usually involves two processes--first, preparing the surface by sanding, filling blemishes, etc.; second, applying protective and/or decorative coatings. The various types of materials may be classified as:

| Stains | | Penetrating Finishes | Surface Finishes | | |
|---|---|---|---|---|---|
| Water | Blonding | Sealers | Paints | Varnishes | Lacquers |
| Oil | | Oils | Enamels | Shellac | |
| Spirit | | | | | |

Stains bring out the beauty of the wood and tone it to a desired color. Usually varnish, shellac, or lacquer are applied over the stain. Care must be taken in choosing the correct finish to apply over oil and spirit stain. Shellac is a good sealer to use over oil stain before applying varnish.

Penetrating finishes protect the outside layer of wood and make possible refinishing of marred surfaces with a minimum of skill.

Finishes may be applied by brush, spray, roller, wiping with a lint-free rag, or dipping. Again, care must be used in choosing the method of applying a particular finish. For convenience and speed, it has been decided that the pencil racks will be finished by dipping in lacquer. This is not as high quality a finish as could be obtained by some other methods; but it is quite satisfactory for small, inexpensive objects.

Finishing Procedure:

1. Fill all holes with plastic wood. Press it in firmly. After 3 or 4 minutes, these places may be sanded.

The following three steps may be performed in any order, depending on which sanders are not in use.

2. Sand the bottom on a belt sander as shown, to bring the lamination ends flush with the bottom. Be sure to hold squarely on the belt, and remove often to examine. Sand the entire bottom just a little so that it is straight.

3. Sand top surface on belt sander. Press very lightly. Keep moving to prevent flat spots. Stop to examine often.

4. Hold the pencil rack against the belt or disc sander to smooth the sides and bring them to the desired angle. Use only top half of the disc sander.

5. Finish sanding inside and holes, as necessary.

6. Nail a cleat to bottom of your pencil rack as in illustration.

7. Wipe off all excess dust and sandpaper grit. Use air hose to blow dust from corners and holes. BE VERY CAREFUL NOT TO BLOW DUST INTO YOUR OWN OR SOMEBODY ELSE'S EYES! Wear goggles. A particle of garnet blown with 60 lb. air pressure can severely damage an eyeball.

8. Print your name and the date on the bottom surface--neatly; this is your "Trade Mark."

9. Dip the pencil rack into the lacquer container in the finishing room. Hold it there for a few seconds to give the solvent a chance to penetrate.

10. Shake off excess lacquer.

11. Place in drying rack.

12. Put all tools and materials back. Brush off bench tops where you worked.

ACTIVITIES REPORT FORM NO. 7

Groups $E_1$ & $E_2$

A. Inertia.

The laws of inertia which apply to bodies at rest and bodies in motion also apply to the human mind. It requires some sort of push or force to get the lazy, inert human brain into operation. Psychologists speak of such fundamental drives as hunger, sex, and fear, or social motives such as the gregarious instinct or the desire for prestige.

Sometimes these drives are abnormally strong. Pasteur was terrified of dogs. The memory of friends and neighbors dying in the agony of rabies after being bitten by an infected wolf drove him to spend his last three productive years developing a vaccine to prevent this dread disease.

However the popular concept of the genius as a bearded recluse or a psychological misfit is now disappearing. While it is true that some highly productive individuals such as Van Gogh demonstrated neurotic or even psychotic tendencies, the greater number of inventors are relatively normal people who have simply worked hard. The artist or inventor is usually not driven by abnormal desires or fears.

"But," you may say, "some creators or inventors are just lucky."

This may be true. A hunter in Pennsylvania was amazed to see the rocks under his campfire burst into flames. They were coal!

However when the Merritt brothers found iron in Minnesota, it was the end of a ten year search. Although they started out prospecting for gold, they were alert enough to recognize the value of iron. Had they not looked long and hard, they would not have been "lucky."

Just as a hard-hitting football team is often credited with creating its own lucky breaks, alert and hard working individuals are most often the ones to whom inspiration and chance bring fame and fortune. Alex Osborn, in Chapter XVIII of Applied Imagination, lists specific examples of rewarding discoveries made by individuals of this type. Photography, argon, penicillin, "Masonite Presswood," Duco finishes, and lithography are among the direct results of this sort of endeavor.[1]

To help you gain a better idea of what specialists are doing to help develop creative ability, a few pages are reproduced from the Student Workbook, used by Sidney J. Parnes in his course, Creative Problem-Solving at the University of Buffalo. The complete workbook may be purchased for $1.50 from the University of Buffalo Book Store, University of Buffalo, Buffalo 14, New York.

## INTRODUCTION TO WORKSHEETS
(Further Instructions Will Be Provided In Class)

The methodology used in this course was aptly described by Michael Montmore as "do-it-yourself thinking." In our present culture we are provided with detailed instructions on how to do most anything, --- instructions which obviate thinking creatively about problems we face. We are so accustomed to this "spoon feeding" that we become unable to cope with new problems and situations in our changing world. Also, we neglect finding better ways to solve old problems.

Just as "do-it-yourself" manuals provide "how to" instructions, so do the following set of Worksheets; but the latter instructions provide know-how for constructing a kind of "machine tool" rather than an end product. These "how to" procedures concern the basics of how to think creatively about any problem you face. The Worksheets should serve as flexible, not rigid, guidelines to creative problem-solving.

The first time you attempt to use this methodology, you will probably find it advantageous to follow each procedure rather explicitly, just like in learning any new skill. After gaining a thorough understanding, you should then be able to adapt the essence of each procedure to your own problems without necessarily following the outline in all its detail. And in most everyday problems you should find that you will be mentally following the procedures almost subconsciously (see example on page 33). But by following the outline more explicitly in the beginning, you will come to see and understand how creativity can be injected at any step in solving the wide variety of problems you will face in the future.

Thus the following Worksheets are designed to allow you to demonstrate to yourself how you can apply creativity at each stage of a logical, methodical problem attack. The main emphasis is on piling up alternatives at every stage of the process, - during fact-finding, problem-finding, idea finding, solution-finding, and acceptance-finding. And, of course, the Worksheets also provide deliberately for exercise,- - practice in using the imagination at every stage. Recent research has demonstrated this practice to have the same kind of beneficial effect on creativity in problem-solving as practice has on other everyday skills we learn.

Students should be aware that the "spirit," not the "letter," of each Worksheet is what is important. You should adapt sheets to suit the special needs of your own particular problem. This is particularly true of certain pages, such as Worksheets 3, 12, and 15. The Worksheets are meant to serve as guides, --- "road-maps," not as restricting boundaries.

Furthermore, one cannot supply a rigid structure for so dynamic a process as creative problem-solving. The textbook emphasizes this in Chapters IX through XIV on the problem-solving "steps." Even though these "steps" can provide a helpful guide, they are not an inflexible "formula" for the solution of a problem. For example, many times the idea-finding step or the problem-finding step may lead to a realization of the need for additional fact-finding. And so with each of the suggested "steps." Therefore there should be continuous review and amplification of earlier Worksheets as the process unfolds.

A suitable solution to a problem may actually be found at any stage of the process. In practice some of the Worksheet steps may become "academic." However, if at least some thought is given to each, refinements are frequently produced that enhance the solution. For obviously there is never a best solution to a creative problem, --- only a "best" solution insofar as we have gone. By spending more effort probing into each of the steps, we are likely to reach a solution closer to the "perfect" one. We obtain much greater insight into our problem in this manner.

Research has shown that extended effort in creative problem-solving leads to a larger percentage of good ideas as more and more alternatives are produced. William J. J. Gordon calls this concept "deferment," or "the capacity to discard the glittering immediate in favor of a shadowy but possibly richer future." Like the person who invests money to obtain greater rewards later, the creative person foregoes the immediate reward of applying his first idea, in expectation of a better solution (greater reward) ultimately.

Throughout all stages of the creative process, incubation can prove as valuable and productive as the more "deliberate" effort expended. Although only one Worksheet (No. 10) specifically mentions incubation, this process should be utilized constantly during the problem attack. Thoughts about the problem should be captured whenever they occur, rather than only during the deliberate listing on the Worksheets. These thoughts should then be studied in relation to those already listed, the next time you are ready to "work" on the problem.

Likewise the stimulation of others" thinking can be introduced in any of the stages even though the Worksheets specifically suggest this only in the idea-finding stage. (See Worksheet 7). Other steps where group stimulation can be especially helpful are Worksheets 3, 4, 11, 13, 14, and 16. A group is not necessary for carrying through the entire creative process outlined. However, the group is an extremely valuable way of enriching our own necessarily limited background of knowledge and experience, just as reading, travel, observation and other means can help us enrich our minds. Many problems you will undoubtedly attack without any formal group assistance; in other you may wish to draw heavily from the results of team or group cross-fertilization.

If you use the Worksheets properly, they should serve to help you make the transition from the habit of conventional problem-solving to the habit of creative problem-solving.

WORKSHEET 1 - "The Mess"

List problems, needs, opportunities for creative problem-solving: To help you think of problems, consider the following: (1) What would you like to do, have, accomplish? (2) What do you wish would happen? (3) What would you like to do better? (4) What do you wish you had more time for?, more money for?, etc.? (5) What more would you like to get out of life? (6) What are your unfilled goals? (7) What angered you recently? (8) What makes you tense, anxious? (9) What have you complained about? (10) What misunderstandings did you have? (11) With whom would you like to get along better? (12) What changes for the worse do you sense in attitudes of others? (13) What would you like to get others to do? (14) What changes will you have to introduce? (15) What takes too long? (16) What is wasted? (17) What is too complicated? (18) What bottlenecks exist? (19) In what ways are you inefficient? (20) What wears you out? (21) What would you like to organize better?

1. _____

2. _____

3. _____

4. _____

5. _____

6. _____

7. _____

8. _____

9. _____

10. _____

11. _____

12. _____

13. _____

14. _____

15. _____

16. _____

17. _____

18. _____

19. _____

20. _____

21. _____

Now go back and select one of the above which you would most like to attack.

## WORKSHEET 2 - The Particular Situation ("Fuzzy Problem")

Write an explanation of the situation, or "fuzzy problem," that you chose for creative attack from the previous sheet: (Tell as a "news story"--reportorially, not editorially. Give facts. Be cautious in use of adjectives and adverbs. Snap a "verbal picture" of the situation, all that you know about it, etc. Answer questions like: Who is concerned? What is happening? When does this occur? Where does this occur? Why does this occur? How does this occur?)

## WORKSHEET 3 - Fact-Finding

The following questions call for information, facts, you would like to have related to the situation described above. (List fact-finding questions, not judicial or creative ones. Don't worry whether or not you can get the information; if you would like it, raise the question).

Questions | Answers (to be obtained from best sources suggested at left)

1. _____ _____

Where might I find the answer (a) _____ _____

(b) _____ (c) _____ _____

(d) _____ (e) _____ etc. _____

2. _____ _____

Where might I find the answer (a) _____ _____

(b) _____ (c) _____ _____

(d) _____ (e) _____ etc. _____

3. _____ _____

Where might I find the answer (a) _____ _____

(b) _____ (c) _____ _____

(d) _____ (e) _____ etc. _____

WORKSHEET 4 - Problem-Finding

List all the creative type problems suggested by the facts of the last sheet. (Problems such as: "How can I...?", "What ways can I...?", "What ideas can I produce to...?", etc. If "fact-finding" or "judicial" type questions occur to you, convert them to "creative" types by stating as, "How can I find out...?", or "How can I decide...?") How many problems of this type are suggested by the "situation" and the additional facts you have been able to gather about it?

1. _____

2. _____

3. _____

4. _____

Stop a moment and ask, "What is the real problem?" "What is my basic objective?" "What do I want to accomplish here?" Ask "Why" of each problem you have listed. ("Why do I want to do this?") As a result of these questions you ask yourself, try to restate and broaden your problem. Try to find problem statements that give you the largest number of possible approaches. Try paraphrasing, finding synonyms in your problem statement, etc.

5. _____

6. _____

7. _____

8. _____

Now that you have broadened the problem, what other aspects or approaches ("sub-problems") can you see that you didn't list earlier (at the top of page)?

9. _____

10. _____

11. _____

12. _____

Now circle the best, most promising problem statement for creative attack (from all listed). Perhaps it is the one that would give you the greatest leeway, the largest number of approaches or areas for exploration,--the one that includes most of the other ones ("sub-problems"). Or it may be one of the narrower statements that is really the crux of the situation. In any event, choose the one which is most significant to you,--the one most in need of creative attack.

Then "star" all others listed that would fit under this selected problem statement (ones that are "sub-problems" or "areas for exploration" under selected problem statement).

Note: You may want to go back and add facts onto Worksheet 2, and questions onto Worksheet 3, now that you have restated your problem. With the new wording, you may be able to list many more facts now.

WORKSHEET 5 - Idea-Finding (deferred judgment)

Problem Statement: (Selected on previous sheet) .....

.....

(Be sure your statement above is clear, concise, as brief as possible, worded as a "telegram"; also, be sure that it starts with words such as "What ways can I...?")

IDEAS (tentative leads to solution) from deliberate idea-finding. (Use starred "sub-problems" of previous sheet as approaches to spur ideas. Also use Osborn's list of Idea-Spurring Questions).

Magnify Modify Substitutes Adapt Other Uses

9. .....
10. .....
11. .....
12. .....
13. .....
14. .....
15. .....

Minify Combine Reverse Rearrange

Judgment:

Now go back and "star" ideas that are more general in nature--the "approaches,"--through which you might find many more specific ideas.

If your original problem statement was quite broad, you may find that your ideas listed on this sheet are really "sub-problems." In effect, you may have only surveyed the problem for possible "approaches" for attack. (For example, consider the problem, "How can I increase sales in this territory?" You might list ideas such as, "obtain more customers," "step up advertising," etc. In cases like this you would choose one of these "approaches" at a time, and then probe for more specific ideas. ("How can I obtain more customers," "How can I step up advertising," etc.) In such cases you will want to repeat this Worksheet (using one of the more specific "sub-problems" as the problem statement each time), and follow all subsequent Worksheet procedures for each of these approaches, or for the one best approach. (See diagram of Type A and B problems on page 35.) Worksheet 6 is provided for this purpose.

WORKSHEET 6 - Idea Finding (deferred judgment) (cont'd.)

NOTE: Ignore this worksheet if your original problem was relatively narrow or if you prefer to explore entire problem statement more fully. (See explanation at bottom or previous Worksheet).

Sub-Problem Statement: (Derived from previous Worksheet) .....

.....

Be sure your statement above is clear, concise, as brief as possible, worded as a "telegram"; also, be sure it starts with words such as "What ways can I...?", etc.

Additional copies of Worksheet 6 and all following Worksheets should be prepared for other sub-problems you would like to attack creatively.

IDEAS (tentative leads to solution) from deliberate idea-finding. (Use Osborn's list of Idea-Spurring Questions.)

Rearrange

Judgment:

Now do back and again "star" those ideas that are the more general ones--the "sub-approaches" through which you might now find many more specific ideas.

## WORKSHEET 10 - Idea-Finding

Additional ideas from individual after incubation: (deferred judgment)

1. _____
2. _____
3. _____
4. _____
5. _____
6. _____
7. _____
8. _____
9. _____
10. _____

NOTE: You may also look at ideas already listed on previous Worksheets and force "hitch-hikes" from each of them.

## WORKSHEET 11 - Solution-Finding

Evaluative criteria: What are the "yardsticks" by which you can mentally test the effectiveness of each of your ideas? These criteria are really a further measure of your sensitivity to problems--problems that might be implicit in changes that would be brought about by each idea. Try to anticipate all the effects, repercussions, consequences that might occur in trying to accomplish a solution to your problem. Ask yourself, "What all might be affected?", "Who all might be affected?" (Look over your facts on Worksheets 2 and 3 for leads as to important criteria. Your ideas should be tested for consistency with the facts.)

1. Effect on _____
2. Effect on _____
3. etc. _____
4. _____
5. _____
6. _____
7. _____
8. _____
9. _____
10. _____

Now go back and circle the most important criteria.

WORKSHEET 12 - Solution-Finding (Cont'd.)

Evaluation of Ideas: List the most important criteria under "Effect on" headings at top of page. Transfer ideas from Worksheets 5, 6, 9, and 10 to this page. Group ideas by general "approaches." (Do not list the obviously "silly" or "impossible" ideas. Transfer these instead to Worksheet 13.) Indicate a rating in each block, such as G ("good"), F ("fair"), P ("poor"), DP ("doesn't pertain"), etc. Make a decision regarding each idea (based on its ratings under the various criteria) by checking or commenting in one of the boxes at the right hand side of the form. If you have a large number of approaches, evaluate these first, and then evaluate only the ideas under the approaches that seem good.

| Ideas grouped by "Approaches" | 1. Effect on | 2. Effect on | 3. Effect on | 4. Effect on | Decision | | | |
|---|---|---|---|---|---|---|---|---|
| | | | | | Use Now | Hold | Reject | Modify (How?) |
| Approach A: | | | | | | | | |
| 1. | | | | | | | | |
| 2. | | | | | | | | |
| 3. | | | | | | | | |
| 4. | | | | | | | | |
| 5. etc. | | | | | | | | |
| Approach B: | | | | | | | | |
| 1. | | | | | | | | |
| 2. | | | | | | | | |
| 3. | | | | | | | | |
| 4. | | | | | | | | |
| 5. etc. | | | | | | | | |
| Approach C: | | | | | | | | |
| 1. | | | | | | | | |
| 2. | | | | | | | | |
| 3. | | | | | | | | |
| 4. | | | | | | | | |
| 5. etc. | | | | | | | | |

NOTE: As you group your ideas on this Worksheet, look for additional combinations or "hitch-hikes" within each approach.

## WORKSHEET 13 - Solution-Finding (cont'd.)

Exercise in creating useful ideas from "silly" or "impossible" ones: List "silly" or "impossible" ideas from Worksheets 5, 6, 9, and 10. After each one, list all conceivable ways the idea might be changed to create useful ideas. What does the idea suggest?, etc? (Some of the rejected ideas from Worksheet 12 might also be treated similarly.)

1.

a. .....
b. .....
c. .....
d. .....

2.

a. .....
b. .....
c. .....
d. .....

3.

a. .....
b. .....
c. .....
d. .....

4.

a. .....
b. .....
c. .....
d. .....

Now do back and circle any modifications which look like good possibilities. Rate these according to your criteria used on Worksheet 11. Make decisions accordingly, as on Worksheet 11. NOTE: The same procedure as above may be employed on many of your ideas to be modified (ones which were checked on previous Worksheet).

## WORKSHEET 14 - Solution-Finding (cont'd.)

NOTE: Worksheets 14-16 are a suggested pattern for preparing to put an idea into effect. Therefore this pattern should be followed for each idea you select for use.

First idea (or combination of ideas) to be developed: (Select from Worksheets 12 or 13):

Ways of implementing, carrying out, accomplishing, gaining acceptance for, insuring effectiveness of, improving, etc.--the idea (deferred judgment).

1. .....

2. .....

3. .....

4. .....

5. .....

Now go back and circle best ones. (Judgment)

WORKSHEET 15 - Solution-Finding (cont'd.)

Selected idea: (same as previous sheet)

FINAL PLAN OF ACTION REGARDING IDEA

| What to do (List best ways of implementing idea as selected on Worksheet 14.) | Who might do it? | When might it be done? | Where might it be done? | How might it be done? |
|---|---|---|---|---|
| 1. | a.<br>b<br>c.<br>d. | a.<br>b<br>c.<br>d. | a.<br>b<br>c.<br>d. | a.<br>b<br>c.<br>d. |
| 2. | a.<br>b.<br>c.<br>d. | a.<br>b.<br>c.<br>d. | a.<br>b.<br>c.<br>d. | a.<br>b.<br>c.<br>d. |
| 3. | a.<br>b.<br>c.<br>d. | a.<br>b.<br>c.<br>d. | a.<br>b.<br>c.<br>d. | a.<br>b.<br>c.<br>d. |
| 4. | a.<br>b.<br>c.<br>d. | a.<br>b.<br>c.<br>d. | a.<br>b.<br>c.<br>d. | a.<br>b.<br>c.<br>d. |
| 5. | a.<br>b.<br>c.<br>d. | a.<br>b.<br>c.<br>d. | a.<br>b.<br>c.<br>d. | a.<br>b.<br>c.<br>d. |
| 6. | a.<br>b.<br>c.<br>d. | a.<br>b.<br>c.<br>d. | a.<br>b.<br>c.<br>d. | a.<br>b.<br>c.<br>d. |

Now go back and circle best alternatives in each block for "who," "when," "where," and "how."

## WORKSHEET 16 - Acceptance-Finding

(Selling the Idea--Getting the solution adopted)

Selected idea: (same as previous sheet) .....

Whom do I need to convince of its value? (Maybe yourself!) .....

What do I want him to do about the idea? .....

.....

(For example: authorize its use; buy the piece of equipment; give me time off to develop it for production, etc.)

| Advantages to him of accepting the idea: (Refer to Evaluative Criteria on Worksheet 11.) If idea "tested" well, these are some of the advantages.) | How to make this advantage obvious to him: (how to visualize it for him, how to present arguments convincingly, etc.) |
|---|---|
| 1. ..... | 1.a. .....<br>b. .....<br>c. .....<br>etc. ..... |
| 2. ..... | 2.a. .....<br>b. .....<br>c. .....<br>etc. ..... |
| 3. ..... | 3.a. .....<br>b. .....<br>c. .....<br>etc. ..... |

| Possible objections he may have to idea: | How to overcome these objections: |
|---|---|
| 1. ..... | 1.a. .....<br>b. .....<br>c. .....<br>etc. ..... |
| 2. ..... | 2.a. .....<br>b. .....<br>c. .....<br>etc. ..... |

NOTE: Copy here your wording of the problem from top of Worksheet 5 (or of the sub-problem on Worksheet 6 if you chose to attack the latter instead).

## WORKSHEET 17

Summary of the problem and how it was solved (or what progress is being made towards its solution):

C. Questions (Woods Lab III) Groups $E_1$ & $E_2$

Study the preceding sheets before answering the following questions:

1. What difficulties are experienced in applying lacquer by brushing?
   a.
   b.
   c.

2. How may difficulty "a" above be overcome?

3. How may difficulty "b" above be overcome?

4. What are the disadvantages of applying lacquer by dipping?
   a.
   b.

5. List possible solutions to 4-a.

6. List possible solutions to 4-b.

# ACTIVITY INSTRUCTION SHEET 7

Groups $E_1$, $E_2$, and C

Woods Lab III

Laminated Pencil Rack - Finishing

Finishing wood usually involves two processes--first, preparing the surface by sanding, filling blemishes, etc ; second, applying protective and/or decorative coatings. The various types of materials may be classified as:

| Stains | | Penetrating Finishes | Surface Finishes | | |
|---|---|---|---|---|---|
| Water | Blonding | Sealers | Paints | Varnishes | Lacquers |
| Oil | | Oils | Enamels | Shellac | |
| Spirit | | | | | |

Stains bring out the beauty of the wood and tone it to a desired color. Usually varnish, shellac, or lacquer are applied over the stain. Care must be taken in choosing the correct finish to apply over oil and spirit stain. Shellac is a good sealer to use over oil stain before applying varnish.

Penetrating finishes protect the outside layer of wood and make possible refinishing of marred surfaces with a minimum of skill.

Finishes may be applied by brush, spray, roller, wiping with a lint-free rag, or dipping. Again, care must be used in choosing the method of applying a particular finish. For convenience and speed, it has been decided that the pencil racks will be finished by dipping in lacquer. This is not as high quality a finish as could be obtained by some other methods; but it is quite satisfactory for small, inexpensive objects.

Finishing Procedure:

1. Fill all holes with plastic wood. Press it in firmly. After 3 or 4 minutes, these places may be sanded.

The following three steps may be performed in any order, depending on which sanders are not in use.

2. Sand the bottom on a belt sander as shown, to bring the lamination ends flush with the bottom. Be sure to hold squarely on the belt, and remove often to examine. Sand the entire bottom just a little so that it is straight.

3. Sand top surface on belt sander. Press very lightly. Keep moving to prevent flat spots. Stop to examine often.

4. Hold the pencil rack against the belt or disc sander to smooth the sides and bring them to the desired angle. Use only top half of the disc sander.

5. Finish sanding inside and holes, as necessary.

6. Nail a cleat to bottom of your pencil rack as in illustration.

7. Wipe off all excess dust and sandpaper grit. Use air hose to blow dust from corners and holes. BE VERY CAREFUL NOT TO BLOW DUST INTO YOUR OWN OR SOMEBODY ELSE'S EYES! Wear goggles. A particle of garnet blown with 60 lb. air pressure can severely damage an eyeball.

8. Print your name and the date on the bottom surface--neatly; this is your "Trade Mark."

9. Dip the pencil rack into the lacquer container in the finishing room. Hold it there for a few seconds to give the solvent a chance to penetrate.

10. Shake off excess lacquer.

11. Place in drying rack.

12. Put all tools and materials back. Brush off bench tops where you worked.

INSTRUCTOR'S GUIDE FOR IMAGINATION PROBLEM, GROUP $E_2$

Week VIII, Plastics Lab I

State: The problem I should like you to consider today is a very real problem, and one for which there are undoubtedly a number of very good answers. We have in the storeroom about fifty or seventy-five of these war surplus plastic windows.

Do: Show sliding plastic window. Move sliding panel back and forth to show how it operates.

State: Notice how one half of the window can be opened or closed, or even removed through one end. The question is--What can we do with them?

We have already cut off a nice little square of plastic about 18" x 20" from each of them and therefore do not need to cut any more windows to obtain more small pieces of plastic. It seems to me there should be some possible uses for these. What can you think of?

Do: Pause 5 or 10 seconds.

State: One possibility might be as a cover for a picnic basket--to keep out the flies.

Do: Pause. Record responses, if any, on blackboard.

State: In what new way could this be used? (Repeat Osborn's questions slowly, pausing after each. Record responses.)

To what other uses could this be put?

Can we adapt or borrow? What else is like this? What ideas does it suggest?

How about a new twist? How about a new look? What could color do?

Idea: Dye black and use for window in a fish house.

How can we substitute? Enlarge? Make smaller, stronger, higher, longer, wider, deeper? Less so?

How about combining? With what?

Idea: Make shelves for rock collection. Fasten sliding window in front to keep out dust.

Do: After five to seven minutes, hand out instruction sheets on making picture holder. Demonstrate sanding, buffing, etc.

IMAGINATION PROBLEM - - Week VIII - - Fall Pilot Study

Notes Made After the Laboratory Session

Enthusiasm seemed very low today. These were the ideas presented:

1st pause: Window for camper that fits on the back of a pick-up.

2nd pause: Fish house window. (At this point instructor suggested the idea of dye to keep out light.)

Other class ideas:

Sewing box top.
Show case.
Guillotine-type cutter.

IMAGINATION PROBLEM - - Week VIII - - Winter 12:00 Class

Notes Made After the Laboratory Session

These contributions were made by students during the pauses:

Fish house window.

Unbreakable garage window.

Child's playhouse window.

Ticket booth window.

Gate or valve in chute.

To ask questions about. (Obviously facetious.)

License plate cover.

IMAGINATION PROBLEM - - Week VIII - - Winter 2:00 Class

Notes Made After the Laboratory Session

The following ideas were produced in such rapid succession that it was difficult to keep up writing them on the board. The class attacked the problem with vigor and enthusiasm.

Doghouse window.
Cover for bread box.
Boat cabin window.
Tent window.
Outhouse window.
Window in canvas cover for sleeping bag.
Sports car body window or ventilator.
Air scoop for sports car.
Window for ticket booth.
Water skiis--shoe style.
Guard on machine--access cover.
Window for ice fish house.
Aquarium window.
Drain or valve in dam.
Feed bin chute valve.
Bird cage.

IMAGINATION PROBLEM - - Week VIII - - Spring Quarter

Notes Made After the Laboratory Session

Students made these contributions during the pauses:

Mailbox opening.
Patent, and use as fish house window.
Tent window.
Flower box cover--hot box in early spring.
Window in cabin cruiser.
Use plastic and mold into utensils, as dishes, etc.
Use sliding action as carrot chopper.
Put box under it and use for fishing tackle.
Seal and use for window on boat bottom for sightseers.
Use as is for shelf for flower pots.

Results were good. The class seemed free of inhibition and made suggestions rapidly.

## Directions

After referring to your class notes and library references as necessary, answer the questions on Page 2.

Return this entire booklet at your next class meeting.

# ACTIVITIES REPORT FORM NO. 8

Group C

Answer the following questions:

1. What is meant by a #180 grit wet-or-dry paper?

2. List three types of abrasive paper we have used in lab work and describe the characteristics of each.
   a.

   b.

   c.

3. What are the basic raw materials from which acrylic plastics are made?
   a.

   b.

   c.

4. Why would a Bakelite phenolic resin be a very poor material from which to make this picture holder?

# ACTIVITY INSTRUCTION SHEET 8

Groups $E_1$, $E_2$ and C

Plastics Lab I

Until fiberglass became popular about ten or fifteen years ago, acrylics were by far the most common plastics to be found in industrial arts shops. Because they are so crystal clear, take such a high polish, and are available in such brilliant colors, Lucite and Plexiglas have appealed to craftsmen and hobbiests throughout the country. They may be formed at about the temperature of boiling water, can be glued, dyed, sawed, and drilled with ease. Acrylic projects have been made by the millions in school shops, camps, YMCA craft classes, and in home workshops.

The acrylics are also used by manufacturers for about the same reasons. As airplane and boat windshields, they provide as clear vision as glass and will not shatter if hit by flying objects. They provide attractive colors in signs and store window displays. They are used for a variety of items ranging from jewelry boxes to drawing instruments. To provide you with a little first-hand experience in working with acrylics, a picture holder has been chosen which you should be able to complete in one class period. The Plexiglas has been cut to size; all that is necessary is to sand and polish the edges and to bend it.

## Picture Holder

Procedure:

1. Slightly round all four corners of plastic piece with a file or coarse sandpaper.

2. With a piece of silicon carbide wet-or-dry paper of approximately #180 grit sand edges of plastic until saw marks disappear. Use water. Do not remove masking paper.

3. Continue sanding with #320 paper. Slightly round each arris by sanding over surface toward edge in direction indicated by arrow.

4. Using gray compound (tripoli) with any wheel, buff all edges briefly (about one minute). Press lightly and keep plastic moving to prevent heat of friction from melting plastic. Note angle of plastic against wheel.

5. Now examine carefully for saw or coarse sandpaper marks. If any remain, remove with appropriate grade wet-or-dry paper.

6. Buff again on gray wheel.

7. When NO marks are visible, move to wheel using white compound. Be sure not to mix compounds on wheels.

8. Remove masking paper and determine--by sight and feel--if edges are smooth and shiny.

9. When edges are satisfactory, clean plastic with soft rag dampened with El-Kol (denatured alcohol). Do not scratch surface.

10. Get a piece of paper towel for use as a holder to prevent burning your fingers later on. Hold plastic against guide on Strip Bender for one minute or until plastic is thoroughly flexible.

STRIP BENDER
(cross section)

11. Bend plastic 180° and hold tightly against edge of bench until it has cooled enough to stay. Protect your fingers with paper towel.

12. Heat second end by holding properly over Strip Bender heating element.

13. Bend to desired angle and hold until cool.

14. Place your name on a piece of paper slipped into picture holder; turn it in for checking.

Plastics Lab I Groups $E_1$ & $E_2$

## Directions

Read the attached material and work out the "Ideation Exercise." Refer to your class notes and to library references as necessary. Apply your imagination in answering the questions on the last page.

Hand back the entire booklet at your next class meeting. Also please return at that time the pamphlet, "The Gold Mine Between Your Ears."

ACTIVITIES REPORT FORM NO. 8

Groups $E_1$ & $E_2$

A. Education for Intelligently-directed Effort.

Professor Leslie J. Nason, Ed.D., in an article in the Mankato Free Press of November 7, 1969, declared that our best living scientists, unlike Edison and Einstein, are products of our schools. These people, he said, believe that "creativity demands an ability to direct mental processes toward an end."

The people whose efforts result in "new ideas in science, music, art, gadgets and solutions to human problems.....observe, listen, question, read, collect data, compare, analyze. Their creativity is closely related to continued mental effort."

Thus we are reminded again that the person who would become outstanding must be willing to apply himself vigorously. This is not a new idea. However, effort alone is not sufficient; planning and control are required. Effort without intelligent direction is like horsepower without a steering wheel. The Creative Education Foundation has compiled research to show that schools can teach people to be more creative by showing them how to direct their efforts. One of the most important facets of the directional control of effort is the separation of evaluation from ideation.

This separation, which is the principal of suspended judgment, is entirely in agreement with the scientific method. However, whereas

the scientific method places greatest emphasis on securing, classifying, and evaluating facts, the creative method places greatest emphasis on the development of hypotheses. These two methods are not mutually exclusive, but entirely complementary. Application of the newly-developed creative techniques results in more hypotheses to evaluate and hence in more chances for an exceptionally good one.

How to Develop Ideas. One of the methods used by highly creative people to help themselves "think up" more ideas is the "Quiz Yourself" idea. Turn now to pages 15 to 22 of "The Gold Mine Between Your Ears" and carefully examine Alex Osborn's suggested questions. These or some others that you may think of will certainly help you when you tackle a knotty problem. Perhaps you should write down these questions somewhere so you may refresh your memory if you forget them. Very likely you will wish to add questions of your own.

B. Exercise in Ideation.

The picture holder we made was very simple. It could have been made in a number of other ways. Just for fun, take some paper and cut out patterns for other picture holders (or other projects) which could have been made from a sheet of Plexiglas. If you wish, use crayon or special pencil lines to show color or other materials needed. Use a dotted line -------- to show a fold. Fasten all the patterns to this page EXCEPT the one you consider most appealing. Save that for question No. 5 on the next page.

C. Questions (Plastics Lab I) Groups $E_1$ & $E_2$

You cannot apply imagination in a vacuum; when you need facts--look them up! Do not forget to turn in "Gold Mine Between Your Ears."

1. What would you say was the most difficult part of making the picture holder?

2. How might this operation have been performed more easily? List 2 or 3 alternative methods.

3. Why do you think the wet-or-dry paper used was made with a silicon carbide abrasive rather than with flint or garnet?

4. What mistakes might an amateur make in buffing a Plexiglas project?

5. Examine the "most appealing" project design you made for the Ideation Exercise on the previous page. List below the difficulties a novice might have in making this project.

# ACTIVITY INSTRUCTION SHEET 8

Groups $E_1$, $E_2$ and C

Plastics Lab I

Until fiberglass became popular about ten or fifteen years ago, acrylics were by far the most common plastics to be found in industrial arts shops. Because they are so crystal clear, take such a high polish, and are available in such brilliant colors, Lucite and Plexiglas have appealed to craftsmen and hobbiests throughout the country. They may be formed at about the temperature of boiling water, can be glued, dyed, sawed, and drilled with ease. Acrylic projects have been made by the millions in school shops, camps, YMCA craft classes, and in home workshops.

The acrylics are also used by manufacturers for about the same reasons. As airplane and boat windshields, they provide as clear vision as glass and will not shatter if hit by flying objects. They provide attractive colors in signs and store window displays. They are used for a variety of items ranging from jewelry boxes to drawing instruments. To provide you with a little first-hand experience in working with acrylics, a picture holder has been chosen which you should be able to complete in one class period. The Plexiglas has been cut to size; all that is necessary is to sand and polish the edges and to bend it.

## Picture Holder

Procedure:

1. Slightly round all four corners of plastic piece with a file or coarse sandpaper.

2. With a piece of silicon carbide wet-or-dry paper of approximately #180 grit, sand edges of plastic until saw marks disappear. Use water. Do not remove masking paper.

3. Continue sanding with #320 paper. Slightly round each arris by sanding over surface toward edge in direction indicated by arrow.

4. Using gray compound (tripoli) with any wheel, buff all edges briefly (about one minute). Press lightly and keep plastic moving to prevent heat of friction from melting plastic. Note angle of plastic against wheel.

5. Now examine carefully for saw or coarse sandpaper marks. If any remain, remove with appropriate grade wet-or-dry paper.

6. Buff again on gray wheel.

7. When NO marks are visible, move to wheel using white compound. Be sure not to mix compounds on wheels.

8. Remove masking paper and determine--by sight and feel--if edges are smooth and shiny.

9. When edges are satisfactory, clean plastic with soft rag dampened with El-Kol (denatured alcohol). Do not scratch surface.

10. Get a piece of paper towel for use as a holder to prevent burning your fingers later on. Hold plastic against guide on Strip Bender for one minute or until plastic is thoroughly flexible.

STRIP BENDER
(cross section)

11. Bend plastic 180° and hold tightly against edge of bench until it has cooled enough to stay. Protect your fingers with paper towel.

12. Heat second end by holding properly over Strip Bender heating element.

13. Bend to desired angle and hold until cool.

14. Place your name on a piece of paper slipped into picture holder; turn it in for checking.

INSTRUCTOR'S GUIDE FOR IMAGINATION PROBLEM, GROUP $E_2$

Week IX, Plastics Lab II

Do: Turn on element in vacuum forming machine for preheating. Pass out blank sheets of paper to students.

State: We have previously talked about some of the industrial techniques in the processing of plastics. This is a small, inexpensive forming machine with vacuum furnished by an ordinary vacuum cleaner. Its operation is very simple. We place the desired mold on the screen and clamp a piece of plastic in the frame.

Do: Demonstrate by performing each step as it is mentioned.

State: We now apply heat to the plastic. You will notice it sags, rather quickly rises in sort of bulges, and in a few seconds sags again as it is heated through. When it is thoroughly flexible, we lower the plastic over the mold and turn on the vacuum.

After allowing the plastic to cool a few seconds, we remove it from the mold and trim the edges. These are some of the molds we have made in our industrial arts classes.

Do: Show sample projects and molds for tidbit tray, fly box, spiral puzzle, etc.

State: This is a mold which did not work because the plastic wrinkled as it was drawn down into the narrow places.

Do: Show drape mold for desk drawer tray and plastic which was tried on it.

Say: This tray can be made by using a cavity mold.

Do: Show successfully molded tray of quite similar construction with cavity-type mold used.

State: These, of course, are only samples of what can be made by vacuum forming. In the next five minutes list as many projects as you can think of that might be interesting and different and which could be made on this machine.

Do: Pause for five minutes. Then proceed with regular lab work.

IMAGINATION PROBLEM - - Week IX

Notes Made After the Laboratory Session

Number of ideas suggested for vacuum-formed projects, listed according to class:

| Fall | Winter, 12 | Winter, 2:00 | Spring |
|---|---|---|---|
| N = 10 | N=10, 2 abs | N=9, 3 abs. | N=17, 1 abs |
| 5 | 2 | 5 | 10 |
| 6 | 9 | 7 | 5 |
| 6 | 6 | 4 | 10 |
| 7 | 2 | 5 | 12 |
| 4 | 3 | 6 | 3 |
| 14 | 2 | 7 | 5 |
| 7 | 6 | 9 | 15 |
| 7 | 3 | 3 | 11 |
| 14 | 1 | 6 | 6 |
| 6 | 4 | | 5 |
| | | | 10 |
| | | | 3 |
| | | | 7 |
| | | | 9 |
| | | | 6 |
| | | | 8 |
| | | | 10 |
| $\overline{X} = 7.6$ | $\overline{X} = 3.8$ | $\overline{X} = 5.8$ | $\overline{X} = 7.4$ |

During Fall Quarter the students were asked to turn in this paper the following week with their lab report. Since eight papers were not returned, students in the Winter and Spring classes were asked to turn in the paper before leaving class.

## Directions

Look over the questions on page 2 in this booklet; then review class notes and library references as necessary. If you do not remember the principles of fluid pressure, you may have to do some reviewing in a general science textbook before answering question 5.

Turn in this entire booklet at your next class meeting.

# ACTIVITIES REPORT FORM NO. 9

Group C

Answer the following questions:

1. Vacuum forming is sometimes used on "short-run" jobs and injection molding for "long-run" jobs of a similar shape. Why?

2. Why is the material used in injection molding always thermoplastic while thermosetting material is used for compression molding and transfer molding?

3. In vacuum forming, what happens if the plastic becomes just a little too warm before being drawn?

4. What differences do you notice between the acrylic plastic used last week and the polystyrene plastic used this week?

5. If the vacuum cleaner we used for forming the plastic draws "5 inches of vacuum," (figure 30 inches of mercury as atmospheric pressure) what was the approximate total downward force on the 10" x 12" sheet of plastic when the vacuum was turned on? (Show your work.)

# ACTIVITY INSTRUCTION SHEET 9

Groups $E_1$, $E_2$, and C

Plastics Lab II

The industrial methods of processing plastic include injection, compression, and transfer molding, plug and ring molding, blow forming, vacuum forming, vacuum forming with plug assist, and calendaring. While the industrial machinery used in these processes is generally huge and expensive, it is possible to adapt certain of these to miniature machines available to school shops. Thus students who are unable or unwilling actually to work in industrial shops may obtain a little more concrete experience and a little better understanding of the problems involved than if they merely looked at pictures or read books.

In the exercises designed for today's laboratory activity, the problems of mold design and construction have been eliminated. However, you will be shown some molds which did not work because you should recognize some of the limitations involved.

## Vacuum Forming and Injection Molding

There are two injection molding machines and three vacuum forming machines in the shop. You will be required to make one good injection molded project and one good vacuum formed project. You may pick the machine and mold of your choice except as you are limited by time or overcrowding at the machines. There is no charge for the injection molded project since only a small quantity of material is used and unsatisfactory projects may be cut up and re-used. The cost of polystyrene for vacuum forming is from 8¢ to 15¢, depending upon the size of the sheet. You must pay for what you use.

Vacuum forming procedure:

1. Place mold in machine on proper platform.

2. Clamp correct size plastic in holder so it is held securely on all four edges.

3. Raise the clamp to the heating element or swing heating element over plastic.

4. Watch plastic carefully. It will sag a little and quickly rise again in bulges. In about 30 seconds (more or less, depending on thickness of plastic and intensity of heat), it will soften and begin to sag. When it is limp, bring the plastic down carefully over the mold and turn on the vacuum.

5. Allow plastic to cool for a few seconds. Turn off the vacuum and remove plastic from mold. Trim as desired.

Injection molding procedure:

1. Turn on machine with thermostat set slightly above the halfway mark.

2. Clamp mold firmly under orifice, being sure to line up correctly.

3. Fill cylinder with plastic and turn handle until increased pressure indicates mold is filled.

4. Cool for about 5 seconds in running water.

5. Disassemble mold. Remove project and trim flash.

6. If unsuccessful, repeat until a good project results.

## Directions

Read the attached material and work out the "Ideation Exercise." Answer the questions on the last page.

Hand in the entire booklet at your next class meeting. If you have not already done so, please return the pamphlet "The Gold Mine Between Your Ears" at the same time.

ACTIVITIES REPORT FORM NO. 9

Groups $E_1$ & $E_2$

A. Creative Imagination--Areas of Application.

This is the last in a series of information sheets designed to help you, IF YOU SO DESIRE, develop some of the unused talent everybody possesses. There is no doubt but that those persons who are very intelligent and who also are highly creative will make the greatest contributions to society. Those who rank lower on the commonly-used intelligence scales but who are highly creative can improve themselves somewhat, but those who can gain most by the study and practice of the principles of ideation are those who rank lower on the tests of originality. Let us review again some of the advice from leaders in the field:

1. Do SOMETHING. Limber up your thinking muscles! Write or draw or list solutions--many of them.

2. Analyze yourself. Decide which of the perceptual, cultural, or emotional blocks are inhibiting you. Then ELIMINATE THE BLOCKS. Isolate the problem and define it. Think of it in wider terms. Investigate the obvious. (Things are not always what they seem--remember the two Indians who were not father and son.) Use ALL your senses. Have the courage to be different. Defer judgment: list all ideas first. Be a doubter; many inventions and improvements have been made by those who wouldn't believe that "It couldn't be done." Free yourself from the desire to compete or cooperate. Concentrate on the problem--not on what others think you should or should not do! Do not be afraid of making a mistake. Many ideas which seem foolish at the moment later lead to undreamed-of success. Exercise patience. Lack of progress tends to be frustrating and discouraging. If you would succeed, you must never quit trying. Even when your first ideas seem "good enough," look for some others. It may be that "the best is yet to come."

3. Understand your mental processes. Remember your "loader," your "judge," and your "thinker-upper." Watch out for your judge when

you are using your thinker-upper. Later you will have good use for him. DEVELOP THE WILL TO WIN! The Statler Hotel chain and Pfister's seed corn were the results of tremendous and extended individual effort.

4. PREPARE YOURSELF FOR CREATIVE THINKING! Get into the mood. Doodling isn't good enough. Allan Ward, Clarence Buddington Kelland, and others have done this by brute force. Use check lists--attribute listing--or the forced relationship technique, whenever applicable.

5. Use the BRAINSTORMING technique. Whether alone or in a group, these rules apply:

a. Do not be critical.
b. Make use of "free-wheeling."
c. Let your imagination roam.
d. Work for quantity. The more ideas you have and express, the more good ideas you will have.

6. Make a Plan. A problem is a "MESS." You can begin by describing the mess and picking out exactly what it is you are trying to do. The next step may be to find facts. Perhaps now you are ready for "idea finding." At this stage, ask yourself questions: multiply? combine? reverse? rearrange? Your Judge has been dying to get into the act--now put him to work. Force him to look at and really examine ALL the ideas. Finally, TRY OUT the solution. This is the climax. Now is the opportunity to TEST it!!

The campaign for increased imaginative ability in science and technology has been carried forward by such individuals as Mr. Kettering of General Motors, Dr. Suits of General Electric, and Mr. A. L. Simberg of AC Spark Plug. The American Society of Mechanical Engineers has conducted seminars to emphasize its importance; The American Society's Committee on Professional Training has deplored the lack of creative ability among highly trained men. The desirability of creative ability in science is well documented. However it is also important in other areas.

Whenever jobs are hard to find--and good jobs always are hard to find and get--the person with imagination has the best chance. Alex Osborn, in his chapter entitled, "Careers Depend Largely Upon Creativity," suggests that a person seeking a job should use imagination: (1) in deciding upon a choice of careers, (2) in looking for an opening, (3) in making an application, and (4) in striving for promotions.

Business leaders must not only attack their own problems with resourcefulness, but they must also encourage their employees to come forth with ideas. The Chrysler Corporation's motto is "Creative Imagination." Six thousand American companies now operate suggestion systems. The Army's suggestion system resulted in over twenty thousand ideas in 18 months, with savings to the U.S. of almost $44,000,000.

Doctors, pastors, lawyers, and other professional people become more useful and more successful when imagination is applied to their daily tasks.

One of the most valuable assets in personal relations is the ability to imagine how the other person feels. We hear a great deal about EMPATHY. In simple terms, this means being able to put yourself in the other guy's boots. Tact and courtesy depend upon how accurately one can predict another person's reactions. In marriage relations--in operating a home--in effective discipline of children--and even in getting along with yourself, creative imagination is often the key to achieving success rather than chaos.

B. Exercise in Ideation.

The exercises below are taken from Chapter XXVI of Alex Osborn's APPLIED IMAGINATION. Work out one of the problems in the space below and on the back of this sheet.

1. List six careers for which you think you might be suited. Check the one for which you think you are best fitted. Tell why.

2. Select the career that appeals to you and list 10 points by way of qualifications which might appeal to a prospective employer.

3. Suggest five "extras" a salesman might work up in order to win favor with a prospective employer.

4. Suggest six ideas to enable your school or college or business to save money.

5. If you were an employer, what three questions would you ask of an applicant in order to evaluate his creative ability?

C. Questions (Plastics Lab II) Groups $E_1$ & $E_2$

After reading about areas of application for creative imagination and working the Ideation Exercise, answer the following questions:

1. How could the unsuccessful tray shown in class be redesigned so that it could probably be made on a drape mold? (Use separate sheets of paper and show top and bottom and side views.) Present several ideas.

2. Make a list of objects you have seen which have been or might have been made by vacuum forming.

3. You may have noticed that if the handle of the injection molding machine is turned when there is no mold under the orifice, no plastic comes out. This is to prevent the melted plastic from oozing out and spilling over the base. If you were to design a machine for this purpose, how would you construct the orifice? Show in a sketch below.

# ACTIVITY INSTRUCTION SHEET 9

Groups $E_1$, $E_2$, and C

Plastics Lab II

The industrial methods of processing plastic include injection, compression, and transfer molding, plug and ring molding, blow forming, vacuum forming, vacuum forming with plug assist, and calendaring. While the industrial machinery used in these processes is generally huge and expensive, it is possible to adapt certain of these to miniature machines available to school shops. Thus students who are unable or unwilling actually to work in industrial shops may obtain a little more concrete experience and a little better understanding of the problems involved than if they merely looked at pictures or read books.

In the exercises designed for today's laboratory activity, the problems of mold design and construction have been eliminated. However, you will be shown some molds which did not work because you should recognize some of the limitations involved.

## Vacuum Forming and Injection Molding

There are two injection molding machines and three vacuum forming machines in the shop. You will be required to make one good injection molded project and one good vacuum formed project. You may pick the machine and mold of your choice except as you are limited by time or overcrowding at the machines. There is no charge for the injection molded project since only a small quantity of material is used and unsatisfactory projects may be cut up and re-used. The cost of polystyrene for vacuum forming is from 8¢ to 15¢, depending upon the size of the sheet. You must pay for what you use.

Vacuum forming procedure:

1. Place mold in machine on proper platform.

2. Clamp correct size plastic in holder so it is held securely on all four edges.

3. Raise the clamp to the heating element or swing heating element over plastic

4. Watch plastic carefully. It will sag a little and quickly rise again in bulges. In about 30 seconds (more or less, depending on thickness of plastic and intensity of heat), it will soften and begin to sag. When it is limp, bring the plastic down carefully over the mold and turn on the vacuum.

5. Allow plastic to cool for a few seconds. Turn off the vacuum and remove plastic from mold. Trim as desired.

Injection molding procedure:

1. Turn on machine with thermostat set slightly above the halfway mark.

2. Clamp mold firmly under orifice, being sure to line up correctly.

3. Fill cylinder with plastic and turn handle until increased pressure indicates mold is filled.

4. Cool for about 5 seconds in running water.

5. Disassemble mold. Remove project and trim flash.

6. If unsuccessful, repeat until a good project results.

Kinning, Darrell R.
An Experimental Study of the Relative Effectiveness of Educational Films Versus Industrial Visits in Learning About Industry.

MF AVAILABLE IN VT-ERIC SET.
Pub Date - 65 92p.

*INDUSTRIAL ARTS; MASTERS THESES; *TEACHING TECHNIQUES; *FIELD TRIPS; *INSTRUCTIONAL FILMS; HIGH SCHOOLS; *COMPARATIVE TESTING; EDUCATIONAL EXPERIMENTS; COMPARATIVE ANALYSIS; CONTROL GROUPS; EXPERIMENTAL GROUPS ST. PAUL; MINNESOTA

The major purpose was to compare the effectiveness of a 16mm motion picture film and an industrial trip on learning about industry. The population consisted of 141 boys enrolled in woodshop at Johnson High School, St. Paul, Minnesota during 1964-65. These were ranked by their Otis Gamma Intelligence Test Scores and divided into equal groups of high, average, and low ability. Random assignment was then made to Group A (field trip), Group B (film), and Group C (control). Group A toured an industrial plant, and Group B viewed films covering approximately the same material as the tour. All three groups were given a test of knowledge related to the treatments, and 7 weeks later Groups A and B were given the same test for a retention measurement. A treatment by levels analysis of variance was the statistical design used for the analysis.

Findings based on an objective test immediately following treatments and the same test repeated 7 weeks later includes: (1) The film treatment was superior to the tour treatment, (2) High and average ability groups achieved significantly higher mean scores than did low ability groups, and (3) High ability groups did not achieve significantly higher mean scores than the average ability groups. Interaction did occur between treatment groups and ability levels on the first measure but not on the retention measure. A bibliography, tour and film outlines, an achievement test, and statistical data are included. This MA paper was submitted to the University of Minnesota. (EM)

# CHAPTER I

## ORIENTATION TO THE PROBLEM

### I. STATEMENT OF PURPOSE

The main purpose of this study was to determine which method, a 16mm motion picture film or an industrial visit, resulted in greater learning when teaching about industry. A second purpose was to determine which method was more effective for high, average, or low ability students. A third purpose was to determine which method resulted in the greater amount of retained learning.

### II. IMPORTANCE OF THE STUDY

Ericson (9, p. 179), taking note of the ever increasing need for everyone in our present culture to know something of the present day developments in industry, stated,

> Understanding of industry and of the industrial society basic to American life has come to be an accepted goal for industrial arts. While this goal is undoubtedly shared by many subject matter areas in our schools, industrial arts should offer unique opportunities for contribution to its attainment. If the teacher is impressed with the value of this goal, he will find many opportunities to do more than give lip service to it.

Derthick (7, p. 26) wrote:

> Specifically, it seems to me that industrial arts can strengthen its position in the high school program by more accurately reflecting our changing technology. Industrial arts should become more closely connected with the major problems of industry. New materials, new processes, new machines, new products should be reflected in the school program. It is in programs where this has not taken place that industrial arts has fallen into disrepute.

Hackett (11, p. 25), in a article entitled, "Study of American Industry is Essential to Liberalizing General Education," stated:

> Work that was formerly carried on in the home or in a village shop is now performed, in many instances, automatically behind factory walls. Today the average boy or girl, to say nothing of adults, knows apallingly little of the technology employed by American industry in producing our material welfare. If we could be somewhat realistic in making statements of the objectives of industrial arts, we might state our purpose to be:
>
> 1. To develop insights and understandings of industry and technology in our culture.
>
> 2. To develop understandings of the opportunities, requirements and working conditions in the technical fields.

3. To develop the ability to use tools, materials and processes to solve technical problems involving the applications of science, mathematics and mechanics.

Streichler and Duff (19, p. 26), wrote, "Industrial education not only implies a development of the concept of industry but demands that this be done." Many other industrial education leaders could be quoted here, but it was felt that the importance of learning about industry was accepted, if not promoted, by most teachers of industrial arts throughout the nation.

Our own Minnesota Curriculum Guide (1, p. 22 and 23) had the following to say about this goal,

> Industrial arts concerns itself with providing and fostering understandings, attitudes and skills, which will enable youth to better understand automation, technological problems, modern industry, and industrial processes.

One of the specific objectives read, "To develop active interests in industry and in the methods and problems of production and exchange."

The investigator consulted his own local curriculum guide (15, p. 1) and found the following statement,

> Industrial arts is the subject matter area which provides an opportunity to understand and appreciate our industrial society with its problems of labor and management, its processes and materials of production and its job opportunities.

If we can agree that learning about industry holds an important place in the teaching of industrial arts, then the next question is, "How can we interpret industry in the industrial arts laboratory?" Streichler and Duffy (19, p. 27) said,

> There are three general methods which the teacher can use to broaden industry-student contact. First, the laboratory or shop could be organized to reflect industrial practices and procedures. Second, the students and teacher may go out to visit and observe industrial enterprise. Third, and finally, many industrial resources and sources can be brought into the classroom.

It was the last two methods with which this paper was concerned.

Most industrial arts teachers believe there is value in taking a class on a field trip, but sometimes making plans and arrangements, as well as providing transportation, getting parents' permission, clearing with school officials, etc., can be a trying situation and often discourages field trips.

An alternative to an actual visit could be an industry-sponsored film. These are available, generally, for the cost of postage. Many companies provide catalogues of the films they supply, film indexes in the school library or audio-visual centers contain many additional free or inexpensive sources, and government agencies list films on various topics. Chosen discreetly, films can bring much of the industrial story into the school. In fact, some films tell more than can be obtained on an actual visit because the camera can frequently penetrate where the human eye cannot. Further, the attention of the student is directed to a much greater extent.

Regardless of which method is used, the industrial visit or the film, they both bring the student and the instructor in touch with many of the same enterprises that they study in school. Not only are they able to see processes, workers in action, materials being handled, and the various facets of industrial organization, but they may discern the problems which grow out of the interaction of these facets of industry. If one method can result in more effective learning than the other, than it

is important that we know which method it is so that in future planning this can be taken into consideration.

## III. STATEMENT OF HYPOTHESES

Six major hypotheses, in the null form, have been formulated for the purpose of investigating the problem.

1. There are no significant differences between field trips, film, and control populations as measured by their average scores on an objective test given immediately after the treatments.

2. There are no significant differences between the high, average, and low ability populations, as measured by their average scores on an objective test given immediately after the field trip, film and control treatments.

3. There is no interaction between the three treatment groups and the three ability levels as measured by their average scores on an objective test given immediately after the treatment.

4. There is no significant differences between field trip and film populations as measured by their average scores on an objective test given seven weeks after the treatment.

5. There are no significant differences between the high, average and low ability populations, as measured by their average scores on an objective test given seven weeks after the field trip, film and control treatments.

6. There is no interaction between the three treatment groups and the three ability levels as measured by their average scores on an objective test given seven weeks after the treatments.

# CHAPTER II

## REVIEW OF THE LITERATURE

The researcher was unable to locate any studies which compared field trips with motion picture films. Hundreds of experimental and survey studies have been made in the past sixty years on the educational influences and effectiveness of motion pictures. Much of this work had been done comparing the amount of learning gained from films with the amount of learning attained from other methods of instruction. The other methods of instruction included special illustrative and printed materials, lectures, demonstrations, readings, filmstrips and slides, etc., but did not include the use of field trips. Because some of the findings in these studies did relate to this study, it was felt that a review of the pertinent literature should be included in this report. Also, to be included in this chapter, is a synopsis detailing the proper use of both field trips and films.

# I. RELATED RESEARCH

Dale, Finn and Hoban (6) wrote an account of the research literature on audio-visual materials. The bibliography contains 163 items and the authors included the following research findings pertinent to utilization of educational films.

1. Using direct questions was the best preparatory technique for film showing.

2. A film followed by verbal discussion was more effective than a discussion before a film.

3. Oral commentary on a film was more effective than presentation without oral commentary or with written titles.

4. Showing films in a classroom produced higher test results than showing films in a large auditorium.

Concerning the relative effectiveness of motion pictures with "dull" and "bright" students, the authors drew these conclusions:

> The effectiveness of films with children of a given level of intelligence must be expected to vary with the subject taught and with the learning outcomes measured. Where effectiveness is considered in terms of verbal responses to information tests,

> films seem to be relatively more effective for dull than for bright pupils. Where effectiveness is considered in terms of ability to make verbal generalizations, films are not as effective for dull as for bright pupils.

In a report by Hoban (13), he summarized and interpreted the result of a five-year study of motion pictures in the schools. No bibliography was included, but the author drew from his previous works. In discussing the role of the teacher, he suggested these pre-film presentation activities:

1. View the film before presenting it to a group and plan pre-showing and post-showing activities.

2. Relate the film content to the pupils' previous knowledge.

3. Before presentation, give an oral preview of the film and point out which features the students should particularly attend to.

After the film presentation, the teacher should review the film and conduct a class discussion in order to clarify misunderstandings. The teacher should determine whether a second showing is justified, and if so, indication should be made as to what it is necessary to observe.

In another section the author, Hoban, attacked the generalization that films are better for "dull" than for "bright" students because they are less abstract than verbal instruction. In this regard, the author stated that dull students needed specially designed films that moved at a slower pace, had more detail, had clearer transitions, and used simpler vocabulary and sentence structure.

From more than 200 research studies reviewed by Hoban and Van Ormer (14), several principles of film design were evolved. One of these principles stated that familiarity with the subject matter of a film, level of intelligence, formal education, and reading ability correlated positively with amount learned from films. The authors maintained that instructional techniques substantially increased the instructional effectiveness of a film. Some of these techniques were:

1. Orienting an audience on what it was going to see or summarizing what it had seen.

2. Announcing that a test would be given after the film.

3. Repeating the important points within a film with variation.

4. Conducting audience participation during or after a film.

5. Informing the learner of how much he has learned by giving test results and correct answers as soon as possible after testing.

The purpose of a study by McTavish (18) was to determine the increment in learning that may be attributed to one, two and three repetitions of a film over and above a single showing. Four, ten minute general science films were shown to each of four groups of college students in such a way that each group saw one of the films once, a second film twice, a third film three times and a fourth film four times. No two groups saw the same film the same number of times in one class period. All subjects were pretested two weeks before the film and post-tested two days after the film presentation. The difference between the mean pretest and post-test scores was significant in all cases at better than the .01 level. Moreover, two showings resulted in a significant increase in all scores for all four films. Three showings, however, did not add significantly to learning over two showings, and

four showings resulted in an even smaller increment for two films and a decrement in the other two. Within the limits of the experiment, the optimal number of immediately successive film showings for student learning was two.

Dichter (8) suggested the following sequence for teaching with audio-visual aids:

1. Evaluation of aid by teacher as to its technical adequacy and relevance to the current teaching program.

2. Teacher prepares himself by previewing the aid, deciding how to use it, and determining what to tell the pupils to look for.

3. Teacher prepares class by giving advance assignment on the material of the aid, relating the material to the groups' previous experience and interests, drilling on the novel vocabulary, and directing the students' attention to aspects of the aid.

4. Presentation of the aid.

5. Follow up as soon as possible after showing the aid with discussion on items they were to attend to, answering questions, testing. When total or partial review of the aid is necessary, the instructor should repeat what features must be attended to.

Dighter also cited the following common errors in the instructor's use of aids: Failing to state the purpose for viewing, asking questions concerning the aid that are too general, showing the aid before the group is motivated or when viewing time is insufficient, failing to give repeated showings of the aid, and using aids only tangentially related to the work at hand.

## II. FILM AND FIELD TRIP SYNOPSIS

There is no one way to use films or take a field trip. Teachers who understand the value and use of films and field trips will find many ways of using them, and they will learn that no one way is best under all conditions. The following procedures contain suggestions from many authorities, and is only meant to be a helpful guide for using the two mediums.

### Procedure for Film Presentation

I. Preliminary planning

1. Preview film and note the specific points of special interest and the frames where they occur

2. Decide on the necessary or desirable supplementary information to be used.
3. Decide how to correlate the film with your pre-arranged course of study.
4. Indicate how the film may be connected with the students' previous experience
5. Select the specific applications to be made within the students' experience.
6. Determine how many times the film should be shown and the purpose of each showing - appreciation, information viewpoint or entertainment - again for study - once more for review or summary.
7. Decide the procedure of presentation - with or without the sound track - teaching reading the captions - or students - or both.
8. Choose the best time to show the film - before or after an explanation or demonstration - or before and also after.
9. Formulate questions and assignments to be used as a follow up of the showing.

II. Prepare class.

1. Give students some reasons for viewing the film.

2. Tell students what to look for.

3. Students should be able to correlate film learning with learning that has already taken place.

4. Alert students to strange or new words and symbols which occur in the film.

5. Inform class that a test will follow.

III. Present Film

1. Multiple showings often are needed.

2. Discussion should be guided by

   A. the questions from the class.

   B. the objectives sought

   C. the difficulty of the concepts

   D. other pertinent considerations

3. Equipment should be ready

   A. projector

   B. speaker

   C. screen

   D. power cord

   E. film

   F. extra reel

   G. projection stand

4. Make sure room darkening facilities and other facilities are adequate.

5. Use other teaching aids which may be co-ordinated with the film, such as models, charts, and slide films.

IV. Follow-up and application can be accomplished in many ways

1. Demonstration
2. Summary discussion
3. Reshowing
4. Evaluation of the film
5. Test
6. Individual and committee assignments or projects
7. Research

Procedure for Taking a Field Trip

I. Preliminary planning

1. Make arrangements with the place to be visited
2. If possible, take advance tour
3. Make final arrangements with the school principal about details of the trip
   A. time schedule
   B. transportation arrangements
   C. finances
   D. permission slips from parents

4. Make tentative route plan
5. Try to work out mutually satisfactory arrangements with other teachers if the trip will conflict with their classes
6. Prepare preliminary lists of questions or other materials which will be helpful in planning with the students
7. Discuss the objectives of the trip and write them down. Include the main objectives on the permit slip which goes home to the parents telling them about the trip
8. Prepare a list of questions and send it ahead to the guide
9. Work out safety and behavior standards for the trip and at the visiting place
10. Discuss and work out ways to document the trip. Everyone should take notes
11. Distribute to students a list of things to look for on the trip, especially at the place to be visited.
12. Discuss appropriate dress
13. Pre-plan with adult helpers going on the trip.

14. Announce to students that they will be tested after the trip.

15. Alert students to new or strange words which might be encountered.

16. Avoid "schoolish" attitude - permit students to relax.

II. Destination Arrival

1. Check group and introduce guide

2. Insure that the group keeps to the time schedule.

3. Give students an opportunity to obtain answers to questions.

4. Make sure the guide holds fairly close to the itinerary agreed upon.

5. Gather students, check the roll again, and make sure everyone returns to school to be excused.

III. Follow-up activities are numerous

1. Discussion.

2. Evaluation of trip.

3. Test.

4. Individual and committee assignments or projects.

# CHAPTER III

## THE EXPERIMENT

The study was conducted at Johnson Senior High School, St. Paul, Minnesota, during the winter and spring of 1965. Johnson Senior High School has a student population of about 2,050 students in grades 10-12. The aptitude and achievement levels of the student body, as measured by standardized tests, is close to the national norms.

### I. PILOT STUDY

During the month of February, 1965, a pilot study for this experiment was conducted at Johnson High School, St. Paul, Minnesota. A class of twenty-four students from the Johnson High School machine shop volunteered to take part in a complete lesson utilizing the 16mm film method for presentation. The lesson was designed to present various facets of industrial knowledge related to the woodworking industry, and consisted of (1) preparation of the students, (2) introduction, (3) first film showing, (4) discussion, (5) second film showing, and (6) achievement testing. All but the second film showing

and achievement testing were completed the first day. A second day was necessary to complete the lesson.

Through observation, group discussion after the lesson was completed, and test item analysis, some very valuable information was obtained about (1) time requirements, (2) rate of delivery, (3) clarity of expression, (4) motivation of students and (5) explicitness, discriminating power, and difficulty of test items.

As a result of this experience a time schedule for the actual experiment was set and final arrangements for administering the treatments were made. Some changes in the delivery were made, as a direct result of student discussion at the end of the lesson.

The most dramatic change was made as a result of the pilot study in the criterion test. Some items were reworded and a few were dropped completely. The arrangement of test items in sequence, pairing off the items according to difficulty, was also accomplished at this time.

## II. POPULATION AND SAMPLING

The population for this study consisted of all students (141 boys) enrolled in woodshop at the time of the experiment. These students were placed in rank order according to their scholastic aptitude as measured by the Otis Gamma Intelligence test (which is administered to all students enrolled in the St. Paul Public Schools at the beginning of the ninth grade), and then divided into three equal numbered groups. These groups were labeled high, average and low ability and consisted of forty-seven students each. Individuals within each ability group were then randomly assigned to one of three treatment groups: Treatment A Group (field trip), Treatment B Group (film), and Treatment C Group (control). Treatment Groups A and B were assigned 16 students from each ability level and Treatment C Group was assigned 15 students. Since all students would probably not be present on the day of the experiment or tests, only fourteen students in each of the nine cells were used for statistical purposes. The remaining students were randomly selected to act as alternates in case of absence. See Table I.

TABLE I

ASSIGNMENT OF POPULATION TO TREATMENT
AND ABILITY GROUPS
(N = 141)

| | Group A Film | Group B Trip | Group C Control | Totals |
|---|---|---|---|---|
| High | 14 plus 2 | 14 plus 2 | 14 plus 1 | 42 plus 5 |
| Average | 14 plus 2 | 14 plus 2 | 14 plus 1 | 42 plus 5 |
| Low | 14 plus 2 | 14 plus 2 | 14 plus 1 | 42 plus 5 |
| TOTALS | 42 plus 6 | 42 plus 6 | 42 plus 3 | 126 plus 15 equals 141 |

Table II presents a breakdown of the number of years of previous experience in industrial arts of the students in each cell. It was felt that differences in amount of prior industrial arts experience might prejudice the results of the experiment.

Another variable which might bias the results of the experiment was grade level. An analysis of the students by grade level placement within each cell is shown in Table III.

Table IV desciibes the sample further by designating the means and standard deviations of the Otis Gamma I.Q.'s of the sample.

Table V shows the means and standard deviations of reading scores for the entire sample. The mean reading score was obtained by averaging each student's three standard reading scores on the Iowa Test of Educational Development given in the ninth grade.

A treatment by levels analysis of variance was performed on the variables described in Tables II, IV and V. The results showed that there were no significant differences between the mean scores of treatment groups but, as expected, there was significant differences among ability levels on each of the variables. Inspection of Table III indicates similar equality. Appendix A contains the analysis of variance tables.

## III. EXPERIMENTAL DESIGN

The subjects in this experiment were divided, on the basis of IQ scores, into three ability levels (high, average and low). Within each of these ability levels, they were randomly assigned to one of three treatment groups. Treatment A Group was oriented and conducted through an industrial plant; Treatment B Group was oriented and shown a 16mm film presenting the same information experienced on the industrial tour; Treatment C Group (control) received no instruction.

On the day of the experiment all woodshop students were excused from their regular school routine. Treatment Group A visited the Andersen Corporation, Bayport, Minnesota, in the morning, and was administered the initial learning criterion test immediately following the completion of the tour treatment. Treatment Group B viewed a 16mm film on the Andersen Corporation at Johnson High School in the afternoon, and was administered the initial learning criterion test immediately following the completion of the film treatment. The Control Group, which did not experience the tour or the film, reported to

school in the afternoon only to be administered the initial learning criterion test.

Approximately seven weeks after the initial learning task, the initial learning criterion test was re-administered to Treatment Groups A and B. The students were given no previous indication that the test would be repeated. They were told to report to one of Johnson's large team teaching rooms two days in advance, but were not given a reason for reporting there.

Although the primary concern of this study was to test for significant differences between the two teaching methods (Treatments A and B) on the basis of criterion test scores, the use of the ability levels made it possible to determine if high, average or low ability students achieved significantly more from one method or the other. Retesting for retention of learned content several weeks later was yet another concern of this study.

Differences in criterion test scores between the film and tour groups could be attributed to the method of instruction provided it could be demonstrated that the groups differed systematically in no respect other than the treatments employed. A treatments by levels analysis

of variance design was employed to test for significant differences between treatment groups, between ability levels and for interactions.

The independent variables were (1) instruction methods and (2) ability levels. The dependent variables were (1) initial learning as measured by an objective test administered immediately after instruction, and (2) retention as measured by the same test seven weeks later. The controlled variables included (1) consistency of presentation of each method, (2) content of instruction, and (3) test and testing conditions.

## IV. LEARNING TASK

"To learn about industry" is an ambiguous and all-inclusive objective which by itself can take on many meanings. To define and limit this objective somewhat this experiment included in the learning task the following areas of concentration: (1) Tools, machinery and equipment, (2) materials, (3) organization, (4) processes, (5) production, and (6) opportunities as each related to the work of the Andersen Corporation, Bayport, Minnesota.

A complete unit on industry could not possibly be presented during the time it takes to view a film or make an industrial visit, so it must be pointed out that the learning task for this experiment must necessarily be but one lesson of many included to reach the generic objective. The problem at hand was to determine if differences in the method of presentation resulted in significant differences in learning.

Both the tour and the film treatments included approximately the same information and only that information which was included in both treatments was used in the criterion test. Because the film could not be changed, the tour was designed to parallel the film. Some items of information that were included in the film could not be included in the tour and some items usually covered on the tour could not be added to the film. The film was carefully analyzed to derive test items and then these items were screened in light of the content covered on the tour.

As many as possible of the instructional techniques (synopsis in Chapter II) for obtaining the best results in showing a film or taking a field trip were incorporated into the treatments. The content for both

treatments, in order of presentation, included: (1) Preparation of students, (2) introduction, (3) tour or first showing of the film, (4) discussion, (5) second showing of film for Treatment Group B, and (6) criterion test.

The St. Paul area sales representative from Andersen Corporation presented both treatments to the students to ensure that both groups received the same learning content. It was also felt that having a single instructor present the lesson to both treatment groups would also lessen the chances for differences in criterion scores being caused by reasons other than the learning task itself. Outlines for both Treatments A and B were authored jointly by the Andersen representative and the investigator.

Appendix B contains the content of the tour treatment and Appendix C contains the content of the film treatment.

## V. CRITERION TEST OF ACHIEVEMENT

In the absence of standardized tests dealing with the lesson content, it was necessary to construct an achievement test to be used as a criterion measure. The

achievement test contained forty-four multiple choice items measuring achievement in the following selected areas of industry:

1. Tools, machinery and equipment
2. Materials
3. Organization
4. Processes
5. Production
6. Opportunities

An attempt to check the content validity of the criterion test was made by discussing each test item with the Andersen representative who administered the film and tour treatments to ascertain whether or not each test item would be answered by the content of both treatments. Fellow staff members at Johnson High School, as well as the machine shop students involved in the pilot study, also answered the questions on the test after viewing the film.

A test reliability correlation of .73 was obtained by applying the Kuder-Richardson formula, $r = \frac{n}{n-1} \times \frac{S_2^t - pg}{S_2^t}$ to the scores of students in the combined

Treatments A and B Groups on the initial learning test. This formula is normally used for estimating the reliability of tests which contain items of equal difficulty. A test item analysis revealed that items on this test were not of equal difficulty, and it was therefore safe to assume that the .73 estimate was conservative. The test is contained in Appendix D.

## VI. ADMINISTRATIVE PROCEDURES

Because the investigator had viewed the Andersen Corporation 16mm film, "Windows From the Friendly Valley," and toured the plant at Bayport, Minnesota, in previous years, he was well aware of the willingness of the Andersen Corporation to co-operate with the public schools in providing a better knowledge of their company and its products. As one of the largest window manufacturers in the world, the Andersen plant represented a realistic though limited, picture of modern-day industry.

One of the first things necessary to begin this study was to acquire the 16mm film used in the film treatment ("Windows From the Friendly Valley"). After conferring with the sales manager at Andersens, and explaining the

proposed study, it was possible to obtain the film for as long as necessary. To briefly describe the film, its contents included the following major parts:

1. Functions of a window with many scenes showing different types in various settings.

2. Description of the wood used and where it came from.

3. Description of the Andersen plant.

4. Handling of material as it arrived at the plant.

5. Ripping and crosscutting operations.

6. Lineal and cross milling of window parts.

7. Quality control at various steps in window manufacture.

8. Machine shop where sharpening and special setups and modifications were made.

9. Other machines such as routing, mortising, automatic nailing and screwing machines.

10. Other machines such as those used for installing hardware, sanding the wood, and pneumatic guns.

11. Treating of the window parts to prevent decay and repel insects.

12. Testing laboratory where tests were conducted to determine nail holding strength, strength of glue joints, air and moisture leakage, plating thickness of hardware, etc.

13. Window assembly including glazing and nailing.

14. Packing and shipping of windows.

Because seven guides conducted the actual tour through the plant, it was felt that even though all seven were very familiar with all phases of the plant, some necessary information might be excluded unless these people had outlines to follow as well as a briefing before the tour. See Appendix E for tour guide outline. Every attempt was made to insure that all of the content included in the test items was covered in the tour. To overcome the problem of not being able to hear the guide, only six or seven students were assigned to a guide and portable public address systems were used.

Tentative arrangements for the day of the experiment had previously been made with the Andersen Corporation and the administration at Johnson High School. These arrangements were finalized upon completion of the pilot study. An agenda sheet for the day of the experiment was made. (See Appendix F) The Johnson High School staff was

briefed on the experiment at a faculty meeting and a list of all woodshop students to be excused for the experiment was given to each teacher.

The students were not told why they were being excused from a day's classes until three school days before the experiment. At this time each woodshop class was told about the experiment, what it was, the importance of it, how it was going to be done, and the necessity for obtaining their complete cooperation. A letter explaining the experiment was given to each student for their parents to read. (See Appendix G) This letter contained the student's assignment or designated treatment group and included a parental permission slip to be returned by the students going on the tour.

On the day of the experiment Treatment Group A met at 7:45 A.M. in front of Johnson High School at the bus which was to take them to the Andersen Corporation, Bayport, Minnesota. Roll call was taken and student guide sheets were distributed. (See Appendix H) These sheets were explained to the students and directions were given to study the items on them during the trip to Bayport. It was also recommended that the sheets should be used to take

notes or write down any questions that might arise during the tour. Conduct and safety precautions were discussed briefly, and it was announced that a test would be given following the tour.

At 8:45 A.M. Treatment Group A toured the plant and at 10:15 A.M. thirty minutes was allocated for discussion. The time allotted for discussion was ample, and the students' attention and interest seemed excellent. At approximately 10:45 A.M. the initial learning criterion test was administered. Directions at this time were brief because all students were familiar with the traditional multiple choice item type of test.

Every member of Treatment Group A completed the achievement test before 11:30 A.M., at which time the bus was boarded and the group departed. Because the students were excused from classes for the remainder of the day, most of them were released from the bus at various locations near their homes on the way back to Johnson High School. Those that did stay on the bus were dismissed about 12:00 noon and were not allowed to enter the school. Students were directed to go home immediately, to prevent interaction between the treatment groups.

Treatment Group B reported to Room 108, one of Johnson High School's large team-teaching rooms at about 12:30 p.m. It was announced that a test would be given after the film; the first film showing took place about 1:00 p.m., and the after-film discussion began at 1:20 p.m. The discussion was lively and questions numerous. At approximately 1:50 p.m. the film was shown a second time, and at 2:10 p.m. the criterion test was administered. The same directions were given to Treatment Group B as had been given to Treatment Group A. Also, the same visual aids used in the discussion at the Andersen plant were brought to Johnson High School to use in Treatment B. These visual aids included a model window, plastic divider strip, safety glass, weather stripping, and friction hinges. By 3:00 p.m. Treatment Group B had completed the criterion test and were excused at the school dismissal bell.

Treatment Group C reported to Room 13, a large classroom at Johnson High School, at 1:00 p.m. where a Johnson High School counselor administered the criterion test to the group. It was reported that students worked dilligently. Room 13 was chosen because of its proximity to a building exit. All students were excused at 1:50 p.m. and left the building to go home.

Seven weeks later, without prior notice, Treatment Groups A and B were re-administered the criterion test to check for retention. These students were excused during the second class hour of the day and assembled in a large team-teaching room. Students were well behaved and completed the test easily in the time allotted.

# CHAPTER IV

## FINDINGS

The purpose of this chapter is to report the findings and the results of tests of hypotheses.

Table VI presents the means and standard deviations of the scores on the initial criterion test by treatment and ability groups.

TABLE VI

MEANS AND STANDARD DEVIATIONS OF SCORES ON THE CRITERION TEST ADMINISTERED IMMEDIATELY AFTER INSTRUCTION

| | Treatment A | Treatment B | Treatment C | Totals |
|---|---|---|---|---|
| HIGH | X = 25.5<br>S = 5.5 | X = 32.5<br>S = 3.6 | X = 14.8<br>S = 7.5 | X = 24.3<br>S = 9.3 |
| AVERAGE | X = 26.5<br>S = 2.6 | X = 28.6<br>S = 4.1 | X = 14.9<br>S = 3.6 | X = 23.3<br>S = 7.0 |
| LOW | X = 21.1<br>S = 3.8 | X = 23.3<br>S = 8.3 | X = 15.0<br>S = 4.4 | X = 19.8<br>S = 6.8 |
| TOTALS | X = 24.5<br>S = 4.7 | X = 28.1<br>S = 6.9 | X = 14.9<br>S = 5.4 | X = 22.5<br>S = 8.0 |

To determine if the mean column and row scores were significantly different, a treatment by levels analysis of variance was performed on the initial learning criterion test scores. This analysis has been presented in Table VII, below. Hartley's Fmax test showed that the variances at the .01 level were unequal (Fmax. = 10.4). However, according to Hayes (12), a test of means is not affected by unequal variances when cell frequencies are the same.

TABLE VII

ANALYSIS OF VARIANCE OF INITIAL LEARNING TEST SCORES FOR TREATMENTS A, B AND C

| Source | df | Sum of Squares | Mean Square | F |
|---|---|---|---|---|
| Treatments | 2 | 3897 | 1949 | 75.0* |

| Total | 125 | 7821 | | |

*Significant F at .05 = 3.08 for column and row means, and 2.45 for interaction.

The results showed that the F values obtained were significant in every case. In order to locate where the significant differences lay, the Sheffe' Test was performed on (1) treatments, (2) levels, and (3) interaction.

1. Treatments. The Sheffe' test showed that all treatment means were significantly different from each other at the .05 level.

2. Levels. The Sheffe' test showed that the high and average ability means were not significantly different, but that both means were significantly different from the mean of the low ability group.

3. Interaction. The Sheffe' test results showed no significant interaction among means in the Treatment A and B Groups. However, it should be pointed out that, of those students in Treatment A Group, the average ability had slightly higher scores than the high ability group.

Table VIII, page 45, presents the means and standard deviations of the scores by treatment and level for the criterion test re-administered seven weeks after instruction.

TABLE VIII

MEANS AND STANDARD DEVIATIONS OF SCORES ON THE CRITERION TEST ADMINISTERED SEVEN WEEKS AFTER INSTRUCTION

| Level | Treatment A | Treatment B | Totals |
|---|---|---|---|
| High | X = 22.1<br>S = 6.3 | X = 26.1<br>S = 4.5 | X = 24.1<br>S = 5.8 |
| Average | X = 22.8<br>S = 4.0 | X = 24.8<br>S = 4.0 | X = 23.8<br>S = 4.1 |
| Low | X = 17.3<br>S = 3.5 | X = 21.4<br>S = 6.9 | X = 19.3<br>S = 5.8 |
| Totals | X = 20.7<br>S = 5.3 | X = 24.1<br>S = 5.7 | X = 22.4<br>S = 5.8 |

To determine if the resulting mean scores were significant, a treatment by levels analysis of variance was performed on the retention test scores. This analysis has been presented in Table IX, page 46. Hartley's Fmax test showed that the cell variances were not significantly different.

TABLE IX

ANALYSIS OF VARIANCE OF RETENTION TEST SCORES FOR TREATMENTS A AND B

| Source | df | Sum of Squares | Mean Square | F |
|---|---|---|---|---|
| Treatments | 1 | 233 | 233.0 | 9.2* |
| Levels | 2 | 401 | 200.5 | 7.9* |
| Treatments X Levels | 2 | 19 | 9.5 | .37 |
| Within | 78 | 1973 | 25.4 | |
| Totals | 83 | 2626 | | |

*Significant F at .05 = 3.08.

The results showed that there was a significant difference between treatments and among levels. In order to locate where the significant differences were, the Sheffe' test was used.

1. Treatments. The Sheffe' test results showed that Treatment B Group achieved significantly greater than Treatment A Group.

2. Levels. The Sheffe' test results showed a significant difference favoring the high and average ability students over the low ability students, however,

the high ability students did not differ significantly from the average ability students.

Shortly before the administration of the treatments it occurred to the investigator that an interesting addition to the study would be to obtain students' reactions to the field trip and film treatments. A tally of these reactions revealed that all of the students in both treatments responded with favorable opinions about the type of learning experience they were provided.

# CHAPTER V

## SUMMARY, CONCLUSIONS AND DISCUSSION

### I. SUMMARY

The major purpose of the study was to determine which was more effective in learning about selected aspects of industry, a film or a field trip. Other purposes were to determine if students of varying abilities benefited differentially and whether any interaction resulted between the treatments and the ability levels.

The sample consisted of all students at Johnson High School, St. Paul, Minnesota who were enrolled in woodshop for the school year 1964-65. The students were first placed in rank order according to scholastic aptitude and then divided into three equal numbered groups. Individuals from within each ability group were then randomly assigned to one of three treatment groups; field trip, film or control. On the day of the experiment the sample was excused from the regular school routine. The field trip group toured the Andersen Corporation, Bayport, Minnesota, in the morning, and, immediately after the tour treatment, completed an initial learning criterion test. In the

afternoon, the film group viewed a film covering the same selected aspects of industry and completed the criterion test immediately after the film treatment. The control group, which neither went on the tour or viewed the film, was administered the criterion test in the same afternoon. Seven weeks after the experiment, the criterion test was re-administered to the field trip and film students to test for retention. Variables such as IQ, reading ability, grade level and previous woodshop experience were used to describe the population and determine whether the randomization procedure resulted in forming treatment groups which were not significantly different. A treatment by levels analysis of variance design was used in the statistical treatment of the data.

## II. CONCLUSIONS

Before drawing any conclusions it was felt that certain limitations inherent in the design should be mentioned. The Andersen Corporation representative who presented the film and tour treatments did not represent a random sample of industrial representatives nor did the film and tour represent a random sample of industrial films and tours.

Also, the subjects cannot be assumed to be a random sample of high school woodshop students. Therefore, any attempt to generalize beyond woodshop students attending Johnson Senior High School or to other tours and films must be done with great caution.

Concerted effort was made to present the two treatments equally well but it was found that not only was it difficult to provide the same learning content in each treatment, it was equally difficult to administer the learning content in the two treatments with equal emphasis. The criterion test which was so important in determining the results of this study was designed to give results which would be as valid and reliable as possible, but represent a limited interpretation of "understanding industry."

With the foregoing considerations in mind, the investigator drew the following conclusions:

Hypothesis 1. There were significant differences (.05 level) between the field trip, film and control populations as measured by their average scores on an objective test given immediately after the treatments.

Evidence indicated that the film treatment was significantly superior to the tour treatment, and that the

mean scores produced by the tour and film treatment populations were significantly greater than those produced by the control treatment population.

Hypothesis 2. There were significant differences (.05 level) among the high, average and low ability populations as measured by their average scores on an objective test given immediately after the field trip, film and control treatments. Evidence indicated that high and average ability students achieved significantly higher mean scores than low ability students. Evidence did not indicate, however, that high ability students did significantly better than average ability students.

Hypothesis 3. There was an interaction between the three treatment groups and the three ability levels as measured by their average scores on an objective test given immediately after the treatments. This was probably due to the fact that, for the tour treatment, the average ability students had slightly higher mean scores than the high ability students.

Hypothesis 4. There were significant differences (.05 level) between field trip and film populations as

measured by their average scores on an objective test given seven weeks after the treatments. Evidence presented indicated that the film treatment produced significantly higher mean scores than the tour treatment.

Hypothesis 5. There were significant differences (.05 level) between the high, average and low ability populations as measured by their average scores on an objective test given seven weeks after the field trip, film and control treatments. Evidence presented indicated that both the high and average ability groups had higher mean scores than the low ability group. However, the high ability students did not score significantly higher than the average ability students.

Hypothesis 6. Evidence presented indicated there was no interaction (.05 level) between the field trip and film treatments and the three ability levels as measured by their average scores on an objective test given seven weeks after the treatments.

# III. DISCUSSION

On the basis of evidence presented in this study, it was concluded that a 16mm motion picture film was a more effective learning device than an industrial tour when teaching about certain aspects of industry. This does not mean that all films produce greater learning than all industrial visits, but it does indicate that if a good film is available about a certain industry the chances are good that the students can learn just as much factual information, if not more, from the film than if the students were actually able to visit the industry.

Much depends on the method of presenting both the films and industrial visits. Many textbooks and other written materials are available to guide the teacher in their use of these audio visual tools and should be consulted to give direction to the techniques of presentation. The synopsis presented in Chapter II is but one source that suggests many procedural techniques teachers can incorporate, either wholly or in part, into their lessons when using films or field trips. Needless to say, tools are only as good as those who use them.

It must be remembered that there may be other advantages to using the tour method. Freeman (10) makes the statement, "The film's value lies in its ability to furnish a peculiar kind of content or experience rather than its stimulating effect." Field trips, without doubt, do provide a welcome break in the daily routine of the student's school day and it is quite likely that the motivation induced by such a trip may offset other advantages of a film.

Because both the film and tour treatments in this study constituted a break in the usual school routine, this "stimulating effect" was probably nearly equal for both treatments. This may explain why student reaction was 100 per cent favorable for both the film and tour when asked to write on the back of their tests whether they did or did not like the particular presentation. Three of the forty-two students present for the film presentation did reply that they would rather go on a field trip, but even these students replied favorably when asked for their reaction to the film presentation.

A replication of the study using different criterion, such as change in attitudes, might be an interesting and enlightening research project.

## TOUR OUTLINE

I. Preparation of students

A. Purpose: learn relationships of shop work to industry

1. Education prepares for living

a. Industrial arts is education

b. Andersen Corporation is real life industry

2. Live in industrial society

a. One industry is woodworking

b. Andersen Corporation is a woodworking industry

3. Unique position of industrial arts in learning about industry

a. Use similar

(1) Tools

(2) Machinery

(3) Materials

b. Not enough - need more - therefore tour to point out

(1) Processes

(2) New tools and machinery

(3) Organization

(4) Production

(5) Opportunities

B. Method: tell how

1. Introduction

a. New words

b. Study items

2. Tour

3. Discussion

a. Clarify misunderstandings

b. Answer questions

c. Introduce related information

4. Achievement test

a. Multiple choice

b. Over forty items

II. Introduction

A. History of Andersen Corporation

1. Origin of Andersens'

2. Present - day operations

a. Floor space - 12 acres

b. Number windows produced annually

B. New words - important to window manufacturing

1. Frames

2. Sill

3. Jamb

4. Sash

5. Glazing

6. Weatherstripping

7. Strikeplate

8. Friction hinge

9. Milling

C. Study items

1. Tools, machinery and equipment

2. Materials

3. Organization

4. Processes

5. Production

6. Opportunities

III. Tour

IV. Discussion

A. Ask for questions

B. Introduce related information

1. Use of plastic in window manufacture

2. Quality control necessary for

a. Proper assembly

b. Ease of operation

c. Beauty

d. Weathertightness

e. Ease of upkeep

3. Mass production - parts uniform size

4. Importance of speed in industry

5. Investment per employee

6. Wages

7. Profit sharing program

8. Rest breaks

9. Where to apply for job

10. Types of jobs available

11. Reasons for industry providing tours

APPENDIX D

ACHIEVEMENT TEST

NAME_____

Learning About Industry
Andersen Corporation
Bayport, Minnesota

DATE_____

GROUP_____

Directions: All items are multiple choice. Choose the best answer and indicate your response in the blank space to the left of each item--letters A, B, C, etc.

_____ 1. The lower most part of a window unit is called the
A. sash
B. jamb
C. sill
D. strike plate
E. template

_____ 2. How many window units does Andersen produce each year?
A. 10,000
B. 100,000
C. 1,000,000
D. 2,000,000
E. 10,000,000

_____ 3. How much floor space does the Andersen plant have?
A. 2 acres
B. 6 acres
C. 12 acres
D. 18 acres
E. 24 acres

_____ 4. What kind of wood is used to make Andersen windows?
A. Douglas Fir
B. Balsam Pine
C. Blue Spruce
D. Ponderosa Pine

_____ 5. Where does the wood for Andersen windows come from?
A. West Coast
B. East Coast
C. Southern United States
D. Central United States
E. Minnesota

_____ 6. One of the advantages of choosing the particular wood that Andersen uses is low thermal conductivity, this means
A. resistance to weather conditions
B. fire resistance
C. hold paint and color well
D. easily milled
E. low cost

_____ 7. Sawdust and scrap wood at the Andersen plant is
A. thrown away
B. sold to other businesses
C. used to heat the plant in wintertime
D. used to heat the wood-drying ovens
E. three of the above

_____ 8. Moisture content of the wood Andersen uses is checked by
A. weighing it
B. heating it
C. sawing it
D. squeezing or compressing it
E. none of the above

_____ 9. What is done to dry the wood if it has too high a moisture content?
A. stacking it outdoors
B. heating it in large ovens
C. stacking it in storage buildings
D. compressing it in large machines
E. send it back

_____10. Lumber for Andersen windows must be dried to what moisture content?
A. 5%
B. 11%
C. 17%
D. 24%
E. 30%

_____ 11. How are large quantities of rough lumber moved from storage yards to the point where production begins?
A. caterpillers
B. straddlebugs
C. by hand
D. cranes
E. trucks

_____ 12. How does the ripper know where to feed the board into the saw?
A. saw has fingers
B. carefully estimating
C. electric eye
D. movable fence
E. all cuts are the same

_____ 13. Why are rough cut pieces marked with colored ink?
A. to show who cut it
B. to designate the quality of the pieces
C. to identify what it is to be used for
D. to tell when it was cut
E. to give the size of the piece

_____ 14. How is lumber fed into the rip saw?
A. conveyor belt
B. pushed by hand
C. rubber rollers
D. pulled in by helper
E. saw fingers

_____ 15. Conveyor belts are used to
A. keep machines from getting too hot
B. hold windows securely while being shipped
C. deliver the mail to various locations in the plant
D. convey messages from one department to another
E. keep the parts moving on the assembly line

_____ 16. What is lineal milling?
A. grooving
B. cutting to thickness
C. cutting to width
D. rabbeting
E. all of the above

_____ 17. What is crossmilling?
A. dado cuts
B. cutting to length
C. cutting to width
D. A and B
E. A and C

_____ 18. How many sides of a board can be shaped at one time on milling machines?
A. 1
B. 2
C. 3
D. 4
E. 6

_____ 19. Pieces are checked for accuracy by measuring with a
A. template
B. ruler
C. pattern
D. pre-cut piece
E. micrometer

_____ 20. What is done to the wood to preserve it?
A. sprayed with sealer
B. dipped in solution
C. painted by hand
D. stained
E. dipped in paint

_____ 21. Sanding of Andersen windows is done by
A. hand sanding with course, medium and fine sandpaper
B. three different machines using a course, medium, or fine sandpaper
C. sandblasting process using different size grits
D. one machine which sands course, medium and fine all at one time
E. portable electric sanders using fine, medium and rough sandpaper

_____ 22. Automatic screwing machines
A. require the operator to place each screw in the proper slot
B. feed the screw in an upright position to the operator so that he can put the screw into the wood without wasting time
C. fasten the pieces together without the operator even touching the screw or a screwdriver
D. fasten the pieces together loosely so the operator only has to tighten the assembly
E. are used only for packing the windows in crates

_____ 23. Nailing machines
A. are commonly used at Andersens'
B. cannot be used because the windows break so easily
C. do not exist
D. are usually held in a worker's hand
E. can only drive one nail at a time

_____ 24. Application of glazing compound to bed glass into sash frames is done with a
A. gun
B. knife
C. roller
D. glazing tool
E. window scraper

_____ 25. Face glazing is usually done with a
A. knife
B. gun
C. machine
D. window scraper
E. roller

_____ 26. To assist sales on a national level, Andersen windows are usually shipped from the factory directly to
A. retail stores
B. distributors
C. contractors
D. lumber yards
E. customers

_____ 27. Quality control throughout the production of Andersen windows is necessary for
A. proper assembly
B. ease of operation
C. beauty
D. weather tightness
E. ease of upkeep
F. all of the above

_____ 28. Amount of wages paid to Andersen employees depends upon
A. number of hours worked
B. amount of production
C. type of work done
D. two of the above
E. three of the above

_____ 29. The Andersen Profit Sharing Program
A. allows employees to invest part of their earnings in company stock
B. is a substitute for high wages
C. is a partnership between the stockholders and all employees
D. was initiated by the labor unions
E. provides income for retired employees

_____ 30. Production bonuses are paid to Andersen employees for
A. working overtime
B. working nights
C. producing good windows
D. producing at a greater rate than expected
E. not being absent or late for work

_____ 31. Rest breaks are provided by the Andersen Corporation because
A. workers would be physically exhausted without them
B. unions demand them
C. cafeteria sales provide more profit for the company
D. they are deductible from income tax payments
E. workers produce more when rest breaks are provided

_____ 32. If you wanted to apply for a machinist job at Andersen's, where would you report?
A. personnel department
B. guidance department
C. payroll department
D. machine shop
E. accounting department

_____ 33. The amount of money invested in the Andersen Corporation is equal to how much per employee?
A. $100.00
B. $1,000.00
C. $5,000.00
D. $25,000.00
E. $50,000.00

_____ 34. Which of the following workers would be <u>least</u> likely to be employed in an industry such as Andersens'?
A. engineers
B. machinists
C. carpenters
D. machine operators
E. salesmen

_____ 35. In the production of Andersen windows, treating of the wood comes just after
A. cross-milling
B. drying of the wood
C. lineal milling
D. crosscutting
E. glazing of the sash

_____ 36. Why are window parts made by machine rather than hand?
A. hand tools are usually too dull to do a good job
A. there are not enough skilled craftsmen available to make parts by hand
C. mass production requires all pieces to be uniform in size
D. workers would get too tired without machines
E. probably because machines are in style today

_____ 37. In the production of Andersen windows, cross-milling comes before
A. crosscutting
B. ripping
C. attaching of hardware
D. lineal milling
E. sorting of window parts

_____ 38. Plastic is now being used in Andersen windows for
A. weatherstripping
B. glass divider strips
C. guide strips for glider units
D. two of the above
E. all of the above

_____ 39. Where is almost all of the tool sharpening done?
A. on the machines by the operators
B. in the plant machine shop
C. sent out to tool sharpening businesses
D. on the machines by expert craftsmen
E. Andersen Corporation hires someone to periodically come in and do it

_____ 40. All window sash are shipped in
A. wooden boxes
B. crates
C. banded bundles
D. cartons
E. plastic bags

_____ 41. Sash is always assembly by
A. pneumatic gun
B. hand
C. glaziers
D. machines
E. experienced cabinetmakers

_____ 42. Speed is important to the success of an industry because
A. orders tend to stack up
B. working fast makes the time go quickly
C. time is money
D. people are happier when they work fast
E. a fast worker is a safe worker

_____ 43. Machines are used to
A. attach hardware
B. insert weatherstripping
C. nail parts together
D. two of the above
E. all of the above

_____ 44. What is the most important reason for an industry to provide films and/or tours regarding their product and the production of it?
A. attract future employees
B. to promote sales
C. to show how their product is made
D. to tell about the uses of their product
E. to explain mass production

## APPENDIX E

## TOUR GUIDE OUTLINE

I. Starting point

- A. Kind of wood - Ponderosa Pine
  - 1. Where from - West Coast
    - a. California
    - b. Oregon
    - c. Washington
  - 2. Explain thermal conductivity
    - a. Resistance to heat
    - b. Resistance to cold
- B. Moisture content
  - 1. How tested
  - 2. What should be - 11%
  - 3. How accomplished - ovens
    - a. Fuel is waste wood and sawdust
    - b. Also heat plant
- C. Moving lumber
  - 1. Fork lifts
  - 2. Straddlebugs

II. Production

A. Ripping

1. Fingers to determine proper widths

2. Board fed into blades by rubber rollers

B. Crosscutting

1. Pieces marked with colored ink

2. Code

3. Identify what piece is to be used for

C. Conveyor belts keep parts moving on assembly line

D. Lineal milling

1. Cuts with grain

a. Grooving

b. Cutting to thickness

c. Cutting to width

d. Rabbets

2. Four sides can be shaped at one time

3. Pieces checked for accuracy with template

E. Cross milling

1. Cuts across grain

a. Cutting to length

b. Dado cuts

2. Show combination lineal and cross milling machine

F. Wood dipped in soution to prevent decay

III. Machine shop - tool sharpening

IV. Assembly

APPENDIX G

THE SAINT PAUL PUBLIC SCHOOLS
615 City Hall
Saint Paul 2, Minnesota

Johnson High School
1349 Arcade Street

March 15, 1965

Dear Parents and Guardians:

On Tuesday, March 23, 1965, all woodshop students at Johnson High School will be taking part in an important educational study to determine the effectiveness of films and field trips in industrial arts. This letter is written to inform you more about the study.

More and more, teachers of industrial arts are being called upon to include in their curriculum, ways and means for their students to develop a realistic concept of modern-day industry. The question, "How can we interpret industry in the industrial arts laboratory?", becomes paramount.

There are two widely used methods which the teacher can use to broaden industry-student contact: First, have students visit and observe industrial enterprise; secondly, bring the many industrial sources and resources into the classroom. These two methods are most often implemented by a field trip and by a 16 mm motion picture film. The film is used more often because of the ease of presentation.

A problem unveils itself however, when one ponders the question, "Which is more effective in learning about industry, a film or a field trip?" Because educators must be concerned with the effectiveness of learning and not always the ease of presentation, it is important that this study be made.

To further enhance the value of the study an attempt will be made to determine which method, if any, will be most

beneficial for high, average, or low ability students. The importance is magnified by the fact that no research can be found comparing educational films with field trips.

In this study, three separate groups have been formed and will be compared. Group A students will be introduced to and conducted through an industrial plant in groups of five or six by industrial guides. Then, the tour group will assemble, a discussion will be held, and an achievement test will be given.

Group B students will be oriented and shown a 16 mm motion picture film which depicts the same material experienced on the industrial tour. After the film, a discussion period will follow. Then the film will be shown a second time and the same achievement test will follow.

Group C students, a control group, will not experience the film or field trip but will be given the achievement test to determine if significant learning actually does result from the film and field trip treatments.

Students are being excused from all regular classes to insure that there will be no interaction between the three groups. This is very important to prevent previous knowledge of the test items. It is hoped that you will encourage your child to be very prompt in both his arrival and departure from school. Student assignments are given below.

Group A - 8:00 a.m. - Report to bus at main entrance in front of school. Bring parental permission note (see below) and 50c to partially cover transportation.

12:00 noon - Excused.

Group B - 12:40 p.m. - Report to school, room 108.

3:00 p.m. - Excused.

Group C - 1:05 p.m. - Report to school, room 13.

2:00 p.m. - Excused.

- - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - -

PARENTAL PERMISSION NOTE

"We understand the arrangements for taking the Group A woodshop students of Johnson High School to Andersen Corporation, Bayport, Minnesota. We believe that necessary precautions and plans for the care and supervision of the students during the trip will be taken. Beyond this we will not hold the school or those supervising the trip responsible. We give our consent for our child to go on the trip.

## APPENDIX H

## STUDENT GUIDE

Tour of Andersen Corporation, Bayport, Minnesota

I. Tools, machinery and equipment.

A. How do they differ from those in our shop?
B. What is meant by automatic machines?

II. Materials.

A. What materials are used?
B. How are they handled?
C. What is done to wood before production?

III. Organization.

A. How is it determined what type of window is in production?
B. What happens to windows when they are completed?
C. Why is a "chain of command" necessary?

IV. Processes.

A. What is done to wood to prevent decay?
B. Why is some of the glazing done by hand?
C. How are windows assembled?
D. How are windows prepared for shipping?

V. Production.

A. How important is speed?
B. Why do pieces have to be checked for accuracy?
C. How are pieces on assembly line moved?

VI. Opportunities.

A. Why types of jobs are available?
B. How do you go about getting a job?
C. What determines wages?

V. Summary.

A. What is the most impressive phase of window manufacturing?
B. Are most workers skilled tradesmen?
C. What improvement in the operations could you make?

SOURCE SHEET FOR SUMMARIES OF STUDIES IN INDUSTRIAL EDUCATION

(To be filled out, preferably by person making study, at time study is completed and checked by adviser; otherwise by adviser.)

Title AN EXPERIMENTAL STUDY OF THE REALTIVE EFFECTIVENESS OF
(Give exact title from title page -- also subtitle)

EDUCATIONAL FILMS VERSUS INDUSTRIAL VISITS IN LEARNING ABOUT INDUSTRY

Degree granted M.A., Date 1965, No. pages in report 88

Granted by University of Minnesota
(Name of institution)

Where available* Department of Industrial Education
(Source and address)

Purpose of study: The main purpose of this study was to determine which method, a 16mm motion picture film or an industrial visit, resulted in greater learning when teaching about industry. A second purpose was to determine which method was more effective for high, average, or low ability students. A third purpose was to determine which method resulted in the greater amount of retained learning.

Source of data and method of study: The sample consisted of all students at Johnson High School, St. Paul, Minnesota, who were enrolled in woodshop for the school year 1964-65. The students were divided into three ability groups and then randomly assigned to one of three treatment groups, field trip, film or control. Variables such as I.Q., reading ability, grade level and previous woodshop experience were used to determine whether the randomization procedure resulted in forming groups which were not significantly different. A treatment by levels analysis of variance design was used in the statistical treatment of the data.

Findings and conclusions: It was concluded that a 16mm motion picture film was a more effective learning device than an industrial tour when teaching about certain aspects of industry. The film treatment was significantly superior to the tour treatment as measured by mean scores on both the initial learning and retention criterion tests. Mean scores were in general directly related to the students' ability.

A Survey of Industrial Arts in the
Southern Appalachian Region 1964-65

SUMMARY

1. Problem

In recent years the Southern Appalachian Region has received considerable attention concerning its lack of socio-economic and educational development. The Southern Appalachian Region lags behind the nation in the development of human resources. In 1962 Ford[1] said that the percentage of school dropouts and young high school graduates without salable skills was high.

Industrial arts, as a part of general education, is an exploratory and developmental curriculum area dealing with technology, its tools, materials, machines, processes, and with technological changes. This key curricular area has the potential to impart to our youth the nature of our industrial culture as well as to develop pre-vocational knowledge and technical skills.

Although the status of industrial arts programs had not been determined in the Southern Appalachian Region, this subject area was believed to lag behind the national industrial arts programs. This lag, it was felt, might be a contributing factor in the retarded economics growth of the region. It was important to determine the status of industrial arts programs in the Southern Appalachian Region so that adjustment might be made.

---

[1]Ford, Thomas, ed. The Southern Appalachian Region: A Survey. Lexington: University of Kentucky, 1962, Frontispiece.

2. Procedure

A survey of public secondary schools with industrial arts programs in the Southern Appalachian Region was made by mail using the same instruments that were used by Schmitt[1] in his national survey. This consisted of two forms mailed to the principal. The principal was asked to give the teacher's form to the industrial arts teacher. Incomplete forms were returned for completion. The Southern Appalachian Region for this study included the region as defined by Ford.[2] It includes parts of Alabama, Georgia, Kentucky, North Carolina, Tennessee, Virginia, and West Virginia. The eleven remaining counties in West Virginia were also surveyed and reported. As no industrial arts programs were reported in the five counties in Alabama, no schools from Alabama are included in the report.

One follow-up letter was mailed in 20 days and a second letter in 30 days after the original mailing. Personal visits were made to 6.8 percent of the respondents to validate the response. Information collected in this manner was found to be reliable at the 99.0 percent level of confidence.

In order to facilitate comparison with the national study the same editing procedure, data organization (tables), and reporting procedure as were used in the national study.

---

[1]Schmitt, Marshall L. and Albert L. Pelley, Industrial Arts Education. Department of Health, Education, and Welfare, U. S. Government Printing Office, Washington, D. C., 1966.

[2]Ford, Op. cit.

Basically, the data were controlled by 10 enrollment sizes and 4 types of school organization. The 10 sizes were:

| | |
|---|---|
| 1 - 99 | 500 - 749 |
| 100 - 199 | 750 - 999 |
| 200 - 299 | 1000 - 1499 |
| 300 - 399 | 1500 - 2499 |
| 400 - 499 | 2500 and over |

The 4 types were: (1) junior-senior high schools; (2) junior high schools; (3) traditional high schools which includes four-year schools preceeded by eight years of elementary school; and (4) senior high schools which include three and four-year high schools preceded by junior high school.

The data were recorded and analyzed at the West Virginia University Computer Center. The computer output was mostly in counts and percents by item. The tables were organized and computed manually in many instances.

3. Number of Programs

In the Southern Appalachian Region, of 848 schools listed, 48.1 percent had industrial arts programs. Two conditions appeared to be a determining factor as to whether schools had programs. One, the larger the school the more likely it was to have a program. Two, the type of school organization had some influence. Traditional high schools had the highest ratio with 86.2 percent having programs.

Schmitt reported that 73.8 percent of the nation's schools had programs. This was 26.0 percent more schools with programs than in the Southern Appalachian Region.

Schools in the region averaged 1.4 teachers per school compared to 2.2 teachers per school for the nation.

4. Purposes for Teaching Industrial Arts

Teachers in the Southern Appalachian Region ranked the following five purposes as highest from a list of ten purposes for teaching industrial arts.

1. To develop skill in the use of tools and machines.
2. To discover and develop creative technical talent.
3. To develop problem-solving skills related to materials and processes.
4. To develop an understanding of our technical culture.
5. To provide general all-around technical knowledge and skills.

The nation's teachers ranked the same purposes as the five highest but not in the same order.

Principals in the Southern Appalachian Region generally agreed except they would place third the purpose to provide vocational training for those students who would not otherwise have this opportunity.

5. Industrial Arts in Elementary Schools

Feeder elementary schools in the Southern Appalachian Region do not have industrial arts programs in a significant amount. The nation's schools report that 5.8 percent of the elementary feeder schools required industrial arts.

6. Compulsory Industrial Arts

Most of the required industrial arts was in grades 7, 8, and 9 with 23.1, 27.4, and 14.4 percent of the schools respectively requiring industrial arts. In grades 10, 11, and 12 only 4.0, 3.2, and 2.9 percent of the schools required industrial arts. The number of

schools requiring industrial arts has increased steadily but slowly since 1954-55.

7. Expenditures for Supplies and Equipment

Southern Appalachian Region schools spent an average of $574 for equipment and $592 for supplies. Schools with an enrollment of under 400 spent an average of $392 less for equipment and supplies annually than the nation's schools. As the size of the school increased the difference in expenditures also increased. This difference is probably due the fact that the nation's schools have more teachers in the larger schools.

8. Industrial Arts Teacher Preparation

Bachelor's degrees were held by 65.8 percent and the master's degrees by 28.3 percent of the teachers in the region. This was about 5.3 percent more bachelor's and 6.6 percent fewer master's degrees than were held by the nation's teachers.

About 83.0 percent of the teachers held a standard certificate, 5.9 percent had substandard certificates, and nearly 12.0 percent did not reply. Two-fifths of the teachers in the Southern Appalachian Region have 30 or fewer credit hours in technical courses. Nearly 40 percent have 41 or more credits in technical courses. At least 40 credits are recommended for adequate preparation.

9. Salaries and Other Income

Southern Appalachian Region teachers average $5,161 annually for nine or ten months of teaching. This averaged $1,050 less than the salary of the nation's teachers. Low salaries may have been a factor in or encouraged 11.0 percent of the teachers to hold an

additional teaching job for which they earned $659, and 51.2 percent to hold non-teaching jobs for an average of $903 per teacher. This is about the same as extra-job earnings on the national level.

10. Teachers' Age and Experience

Mean teacher's age was 34.7 in the Southern Appalachian Region with 25.6 percent under 24 years of age. As in the nation, Southern Appalachian Region teachers averaged about 9.6 years of teaching experience, and they had had about 2 years less industrial experience than the nation's teachers. The mean years industrial experience for the region's teachers was 3.4 years.

11. Other Responsibilities

Industrial arts teachers had a variety of non-teaching responsibilities such as: coaching, sponsoring clubs and contests, running the bookstore, and others. It would appear to be more economical for administrative aids to conduct the non-teaching chores. This would free teachers for professional duty.

12. Ability of the Students

In rating the ability of their students, teachers placed 9.0 percent above average, 65.9 percent average, and 25.4 percent below average. Comparing these ratings to the national averages, one finds, according to the teachers' rating that the nation has about 1.0 percent more above average, 7.7 percent fewer average, and 6.5 percent more below average students in industrial arts courses. This would seem to have some implications for teacher training institutions.

13. Teaching Practices

Almost 40.0 percent of the teachers prepared their own curriculum guides. The use of textbooks and local district guides accounted for nearly 26.0 percent of the remainder on equal basis.

To start instruction in classes in general industrial arts, woodworking, and general metals teachers most often used the methods: assign one project to the whole class and students select a beginning project from a limited number.

Classes in electricity, power mechanics, and graphic arts were started most often by assigning the student a series of sequential projects and by allowing free selection of projects.

Classes were started by the nation's teachers generally by the same methods except they used the method divide the class into groups and assign different projects to each group 10.0 percent more often. This method should be especially useful in courses in general industrial arts which is the course most often taught in the nation and the Southern Appalachian Region.

14. Supplies

About 95 percent of the students paid for the supplies they used, though the method of collecting for the supplies varied. Eighty-nine percent of the nation's students paid for their supplies in some manner. Almost 5.0 percent of the region's students and 11.0 percent of the nation's students received their supplies free. Many teachers in the region gather industrial waste to supplement the students' supplies.

15. Changes in Courses

Almost two-fifths of the industrial arts teachers reported that they had made changes in their courses. The changes were: new courses for high ability students, general courses, and courses for slow learners. The percent of teachers making changes was equal to the percent of the nation's teachers. However the nation's teachers reported more changes per teacher.

16. Teaching Problems

In indicating their problems in teaching, Southern Appalachian Region teachers ranked the following 5 as first from a list of 20 problems:

1. Arranging and conducting field trips.
2. Finding adequate preparation time for experiments and demonstrations.
3. Keeping up with advances in technology.
4. Keeping equipment in good repair.
5. Securing an efficient text book.

The first 3 ranked positions agreed with the nation's teachers' ranking. In the place of numbers 4 and 5, the nation's teachers placed finding time for helping individual students and providing for the slow learner respectively. Teaching problems for teachers in the Southern Appalachian Region are about the same as the problems for the nation, but the region's teachers placed greater emphasis on the highest ranked problems.

17. Industrial Arts Courses

Nine course titles identify the industrial arts classes taught in the region. They are (in rank order with the percent

that each class was reported): general industrial arts (40.5 percent) drafting(25.5 percent), woodworking (19.9 percent), metalworking (4.4 percent), crafts (2.9 percent), graphic arts (2.1 percent), electricity/electronics (1.9 percent), power mechanics (1.6 percent), and others (0.7 percent).

It may be noted that three courses, general industrial arts, drafting, and woodworking, accounted for 85.9 percent of all classes taught. General industrial arts accounted for almost half of the 85.9 percent of these classes.

At the national level Schmitt identified 16 courses which is 7 more than is taught in the region. The first 8 courses in the nation were also the first 8 in the region. One minor difference in rank order was that drafting was the second most popular course in the region with woodworking third. In the nation's schools the order was reversed. Some major industries were not represented to a significant degree in the courses reported. They are metals, communications, transportation, and electricity/electronics.

18. <u>Instruction</u>

Class time was usually divided into theoretical (related) and laboratory (experimental and developmental) instruction. Generally theory consumed 20.0 to 30.0 percent of the class time, and the remainder was devoted to laboratory. There was some variation; graphic arts students spent 80.0 to 90.0 percent of their time in the laboratory, and students in power mechanics and

electricity/electronics spent about 50.0 percent of their time in the laboratory.

The nation's teachers used their instruction time about the same as did the region's teachers except that the nation's teachers who taught graphic arts used about 10.0 percent less instruction time for laboratory.

19. Class Schedules

Most classes (94.3 percent) were scheduled for one period per day, 84.1 percent were scheduled for 5 days per week, 5.2 percent for 2 days per week, and 6.2 percent were scheduled for 3 days per week. Eighty-four percent of the classes were held 36 weeks or more, 10.4 percent for 18 to 35 weeks, and 5.5 for 13 to 17 weeks.

About two-thirds of the classes in the nation's schools were scheduled for one period per day, 5 days per week, and 36 or more weeks. The major portion of the remaining third of the classes met about equally, one or two periods per day, 5 days per week, and for 13 to 20 weeks.

20. Enrollment

Boys accounted for 98.8 percent of the enrollment in industrial arts courses. The total enrollment was 32,879. Most girls (40 percent) were enrolled grade 12. The average enrollment per teacher was about 18 students. Enrollment was about evenly distributed among all courses. About 48 percent of the students enrolled in industrial arts were in the upper three grades. This indicates the popularity of industrial arts since few students in the upper grades are required to take industrial arts.

21. Course Content

Major areas of instruction are usually identifiable by the course title. However, instruction in industrial arts courses was not limited to the area suggested by the title. In all courses except graphic arts, content was drawn from other subject areas. In the course general woods, for example, the content consisted of 75.0 percent woodworking, the remaining 25.0 percent was divided among drafting, leather, metalworking, electricity/electronics, power mechanics, and others.

22. Observations and Implications

a. While teachers were sincere in responding that they held a first class certificate, almost one-fifth of the teachers observed on the follow-up were teaching out of their field of certification.

b. Many of the laboratories were in a poor condition and ill equipped.

c. Professional assistance was generally not available to the teacher.

d. Students, in some cases, spent too much time hand shaping materials.

e. Instructional materials were not adequate in most programs.

f. Articulation from one level of instruction to the next higher level is usually not well organized or easily identified.

g. In general, teachers of industrial arts have not been able to communicate the ideals of industrial arts education to other professional teachers.

h. The narrowness of industrial arts programs which exist as well as the need for additional programs reflects the poverty of the region.

i. Teachers need assistance for advanced studies and for updating their training. This may be a factor in students failing to elect teaching as a profession.

j. Aid for advanceddegrees should not be limited to a few of the better prepared teachers. Teachers who made lower achievement grades in college may need more aid and training than teachers who were more successful in college.

k. More funds are needed for teachers, salaries, professional assistance, laboratories, equipment, and supplies.

Success Factors in Retaining Potential Dropouts, A Research Report; Experimental and Demonstration Project Extending from June 1964 to December 31, 1967.

Southern Illinois Univ., Carbondale

MF AVAILABLE IN VT-ERIC SET.

Pub Date - Jan68 73p.

EXPERIMENTAL PROGRAMS; *OCCUPATIONAL GUIDANCE; *COOPERATIVE EDUCATION; *OCCUPATIONAL INFORMATION; *HIGH SCHOOL STUDENTS; CONTROL GROUPS; VOCATIONAL EDUCATION; *DROPOUT PREVENTION; EXPERIMENTAL GROUPS; DROPOUT IDENTIFICATION; REMEDIAL PROGRAMS; POTENTIAL DROPOUTS

ALEXANDER COUNTY; ILLINOIS

This study was to ascertain whether two remedial programs would have any effect on the retention of high school students. Potential dropouts and potential graduates in two high schools in Alexander County, Illinois, were identified by objective and subjective measures, and experimental and control groups were established in grades 9,10, 11, and 12 with potential dropouts and graduates in all eight groups. In grades 9 and 10 the program consisted of occupational information and vocational counseling for Tamms High School students and in grades 11 and 12 it consisted of cooperative vocational education for both Tamms and Thebes High School students. The programs were studied for three years with the students passing from one grade to another but maintaining membership in the original experimental or control group. The results indicated that both programs prevented significant numbers of potential dropouts from leaving school. (EM)

Director

Southern Illinois University
Carbondale, Illinois
January, 1968

Note: This project was funded partially as project 06-C7 from ancillary research (4a) funds through the Research Coordinating Unit for Vocational Education in Illinois.

The research reported herewith is a culmination of a three-year study conducted under the direction of Ralph O. Gallington, Professor of Industrial Education, School of Technology, and Professor of Guidance and Educational Psychology, College of Education. It was conducted cooperatively in accordance with a contract between the Research Coordinating Unit, Illinois Board of Vocational Education and Rehabilitation, and the Research and Projects Office of Southern Illinois University. Approvals were given by Vernon E. Burgener, Coordinator of Research, and John A. Beaumont, Director, Vocational and Technical Education for the State of Illinois and by Robert L. Gallegly, Treasurer, Southern Illinois University. The project was conducted by one quarter released time of the director from the School of Technology, Southern Illinois University.

## PREFACE

This is the third and final report to be given on the three-year Experimental and Demonstration Project in vocational education. The research was planned and developed in Unit School District No. 5 of Alexander County, Illinois. The study was longitudinal in nature and began with the fall semester in 1964. Earlier in 1964, "Basic Criteria" for identifying high school dropouts were developed for Unit School District No. 5, Alexander County, Illinois. Another research project in the same geographic area began in 1965 and culminated in a report on "High School Dropouts, Fate - Future - Identification". These two studies described later in this report set the stage for continuing with a study of the dropout problem in Alexander County, Illinois.

The "Experimental and Demonstration Project" set up two remedial programs in the Tamms and Thebes High Schools. The first remedial program was for freshmen and sophomores and the second one was for juniors and seniors. The program for freshmen and sophomores was one which provided for occupational information and guidance, and vocational counseling. This was accomplished by making use of classroom instruction for groups and vocational counseling for individuals. For juniors and seniors, the second remedial program, cooperative vocational education was established. The cooperative vocational education program was actually an interrelated vocational program whereby students in the junior and senior years spent half-time in the schools and half-time on jobs in vocational training. The cooperative vocational education program was conducted in both Tamms and Thebes High Schools whereas the occupational information and guidance program was established in the Tamms High School only.

The first report "An Interim Report" (March 1966) was one in which progress was reported on the setting up of the two programs, and the design of the research which was to be conducted around the programs. The research sought to experiment with the two factors mentioned above which were thought to have influence on the retention of potential high school dropouts. The first report also dealt with the presentation of statistical methods used for establishing experimental and control groups for both of the remedial factors. Further, it included the beginnings of data as collected during the scholastic year 1964-65. Since the research was to be longitudinal in nature, it would eventually establish trends and show the effects of the remedial practices. The first report did not show trends, therefore.

The second report, "A Second Interim Report", (March 1967) began to show the effect that experimental programs were beginning to have on potential dropouts. It was of inestimable value because it began to establish a pattern for this, the final report. It presented a follow-up of students who had been in the program during the previous year (1964-65). The grades by graduating years (1965, 1966, 1967, 1968, 1969, and 1970) were set up for study purposes. The second interim report began to show trends and to present what was described as "successful" and "unsuccessful" students. The successful students were all students who were retained in school irrespective of the records which indicated that some were potential dropouts. The unsuccessful were those who, in spite of all, dropped from the schools participating.

This final report which is presented in the following pages continues with the presentation of data showing "successful" and "unsuccessful" students. In addition to the effects of the two programs on retention, there is in this report an evaluation showing the significance of the data collected on the two remedial programs. It is hoped that this research might provide guidance for other studies of remedial practices in the retention of potential high school dropouts.

# CHAPTER I

## INTRODUCTION

### Background

For a number of years the dropout rate of Alexander County, Illinois has been very high. Over the past few years there have been slight improvements. The fact remains that when this study was started, over 38 per cent of all children entering their freshmen year the Fall of 1959 had dropped out before graduation in June, 1963. During the summer of 1964, a research project was sponsored by Southern Illinois University to investigate "Basic Criteria For Identifying Potential High School Dropouts"[1] in the Unit District No. 5 of Alexander County, Illinois. Later, the U. S. Office of Education gave support to a study "High School Dropouts, Fate - Future - Identification".[2] Upon the completion of these two studies it was possible to identify, to a very high degree, the potential dropouts among students in the Tamms and Thebes high school of Unit District No. 5. At the beginning of this (the present) study all students of both schools were identified according to the instruments and classified so that they could be studied with demonstration remedial practices.

[2] R. O. Gallington, High School Dropouts, Fate - Future - Identification, Southern Illinois University, Carbondale, Illinois, January, 1966, A Research Report, (USOE Project No. 5-85-005).

## The Problem

The problem was to determine whether two levels of remedial practices in occupational information, vocational counseling, and vocational education would retain potential high school dropouts in the high schools of District No. 5, Alexander County, Illinois. The remedial practices were proposed to be studied at two different levels in the four-year high schools at Tamms, Illinois and Thebes, Illinois. Regarding students in the freshman and sophomore classes at Tamms high school, the question was raised: "Will occupational information and vocational counseling instruction have any effect on the potential dropout who often leaves school in this geographic area at about age sixteen?" Another question was raised: "Would cooperative vocational education provide a stimulus for juniors and seniors to continue in the high schools of this geographic area?" To answer these questions, two remedial practices were provided. A study over a three-year period to determine whether these questions could be answered in the affirmative was the main problem.

The problem involved a study of the two experimental factors on two separate student groups, each having a control group in the schools involved or surrounding schools. It was deducted that <u>if among the experimental groups retention was pronounced</u> (better than among the control groups), <u>the experimental factors were valuable in retaining students in high school</u>.

## Hypotheses

It was hypothesized that <u>an interrelated vocational cooperative program would have considerable effect in retaining students</u> at the junior and senior level in the Tamms and Thebes high school. Many of the potential

dropouts had previously indicated that the schools held no great interest for them and that the curriculum for college preparation was not of sufficient interest to motivate them to finish high school. And many of the actual dropouts had mentioned previously that if vocational education of some kind had been provided in the schools, they would have stayed in school longer.

Another hypothesis was that when special attention is given to younger children especially those in the freshman and sophomore years of high school, retention will be increased. The main hypotheses to be tested were: (1) if potential dropouts, under 16 years of age, were taught about occupations and given individual vocational counseling periodically, they would stay in school longer than they would otherwise, and (2) if potential dropouts, over 16 years of age, were provided vocational counseling and cooperative vocational education, they would stay in school longer than they would otherwise.

## The Importance

In recent years it has been stated repeatedly that all children should be retained in school as long as they can profit from the experience. Many outstanding educators in the United States have emphasized that the college preparatory high school curricula do not appeal to all students, especially those who have no ambition to continue beyond high school. Students with special needs for vocational education have often been over-looked in the high school curricula of our nation. The special needs of students should be made known to public school administrators, to parents of the children and to the citizens of the community. Without a preparation for the transition from school to work, students often have found difficulty finding employment and getting adjusted to occupations after leaving school.

Even if retention would not have been affected by these remedial practices, a significant advantage may have been accomplished in that some students in this particular study, after leaving school, might have been able to find employment better and might have been able to make the transition from school to work more satisfying. The latter purposes were not especially emphasized nor studied fully, but they do have considerable importance.

This study was of special importance to Unit District No. 5, where very little vocational education had been provided in the past. Although general business, home economics, and agriculture had been a part of the high schools' curricula, the opportunities for industrial education were completely lacking. The new program initiated by this study, provided for a wide variety of occupational interests. It was an interrelated cooperative program which provided opportunities for students to try a wide variety of occupations. One might sum up by saying that this experimental and demonstration project provided a much wider variety of vocational opportunities than had been known previously in Alexander County.

## Limiting Factors

Limiting factors were recorded in the first interim report and the second interim report. Since the completion of these reports, a few have been added, however, the list that follows was taken largely from the first two interim reports.

1. Both the experimental programs were limited by the number of students who could be included each year of the study. There were potential dropouts and potential graduates among all classes involved. In a class of say thirty (30) students, there might have been fifteen (15) of the class who were potential graduates. These numbers were rather small in each of the classes as they progressed in the various grade levels of the high school.

2. The coordinator could handle only one class of thirty (30) students, and this class was made up of juniors and seniors. Each class of students should have been taught as two groups actually, one group of which should have been juniors and one group of which should have been seniors.

3. Further, the class of 30, more or less, were actually taught in two different schools, Tamms, Illinois and Thebes, Illinois.

4. Scheduling was a particular difficult problem and limited somewhat all of the classes involved.

5. The number of on-the-job training stations were limited because of the sparcely settled community in which the program was initiated and developed.

6. Incomplete and inconsistent student records were available to the researchers.

7. Initially, the community acceptance of a cooperative work study program was a limiting factor. This factor diminished as the program evolved.

8. Facilities and supplies for the occupational information and vocational counseling class were a limiting factor.

9. Facilities and supplies for the cooperative vocational education class were also limiting.

10. Beginning with the fall 1967, the cooperative vocational education students were transported from the Tamms high school to the Thebes high school to combine the instruction and cut costs. This was considered advisable since both schools were to be combined by consolidation during the mid-year, 1967-68.

## Delimitations

In addition to the above limiting factors, there were certain delimitations placed on the project which the researchers felt were necessary to control certain variables and give more definition to the research.

1. The area of study was limited to Unit School District No. 5 in Alexander County, Illinois. This district is also known as the Egyptian District.

2. The cooperative vocational education classes for the eleventh and twelfth graders was programmed in both the Thebes and the Tamms high schools.

3. The control groups for the eleventh and twelfth graders were scattered among the same schools from which the experimental groups were selected.

4. The occupational information and vocational counseling was established in the Tamms high school only.

5. The control groups for the occupational information and vocational counseling class were selected from among the students of the Thebes high school.

6. The period of study was limited, from the beginning of the fall semester, 1964, to the middle of the fall semester of 1967.

7. The students involved in the study were those originally included in the grades graduating in 1965, 1966, 1967, 1968, 1969, and 1970.

## Rationale

If present-day high schools are not providing programs which appeal to students and cause them to remain in school, certain experimental factors should be investigated to determine whether they could have an effect on the retention factor. Many experimental factors should be tried. Students should be interviewed frequently to find out what the lacking elements are in the public-school programs and what might be added to make the programs in the high school more satisfying to students. Special needs should be studied to find out what might be done to meet the specific needs of children.

Approximately 25 per cent of all the people in Alexander County are on relief rolls and need employment. Many are unemployed because they do not have the preparation and background to do the types of work which exists in the neighborhood, state and nation. The public schools should provide them with certain skills which would allow them to become employed after leaving high school, either by graduation or dropout.

Practical remedial practices of many kinds should be evaluated and measured to determine what effect they have among the students in the present-day school curricula. Perhaps the more narrow the remedial practice the more practical one might measure it. It is realized that programs such as a cooperative vocational education program, taking one-half of the school's day, will develop variables many of which cannot be measured accurately.

If students will have been prepared for work in the high school programs involved in this research and if they will have been able to find employment as a result of the program, some worthwhile benefits will have been achieved. The most significant factor in this study is the retention itself. If students will have been retained longer as a result of the program, the programs will have been successful. Students will have become more mature and able to cope with the work-a-day world if and when they leave school.

## Procedure

Early in 1964 all the potential dropouts and graduates were identified in the Unit District No. 5 of Alexander County. This identification was made possible through previous development of criteria for identifying such students. The criteria were based on case studies of paired groups of students who had either graduated or dropped out of the public schools. Correlates were developed and these weighed in terms of influence they might have had on students who had actually left the school system or remained until graduation. With the start of the fall semester, 1964, every high school student enrolled in this district was identified by these criteria as a potential graduate or potential dropout.[1]

---

[1] R. O. Gallington, "Basic Criteria · · · · · ·", op. cit.

Students were selected at random for two programs: (1) The program of occupational information and vocational counseling for students in the ninth and tenth grades, and (2) The program of cooperative vocational education for students in the eleventh and twelfth grades.

In the ninth - and tenth - grade program students selected were rather equally divided between those who were expected to dropout and those who were expected to graduate. During the first year of the study this group was taught as one large class. In other words, the freshmen and sophomores met in the same classroom twice a week for occupational information instruction. Approximately once each month each student in this class was counseled individually for one hour throughout the first year period. Although freshmen and sophomores were taught in one group the first year, the records of each grade were kept separately so that each graduating grade by year could be studied later as the longitudinal research continued. This program was established in the Tamms High School only.

The second group of students (juniors and seniors), somewhat divided between potential graduates and potential dropouts, were selected for the cooperative vocational education program. Here again the two grades were taught as one class in each high school (Tamms, Illinois and Thebes, Illinois) for one class period each day. In each school a class met five days per week. The teacher-coordinator of the cooperative vocational education program provided the instructional program. These students were taught occupational information and given instruction about how to get and hold a job and how to work. Later, each member of the class was actually placed on a job, more or less of his choosing, based upon an employer's willingness to hire him. As mentioned above, the students were taught at the junior and senior levels as

one class, a section each in the two separate high schools. However, the records for each grade were kept separately so that for research purposes an accurate comparison could be maintained among those at the various grade levels.

During the second year (1965-66) of the program, the freshmen and sophomores of the Tamms high school were separated for two levels of instruction. One class was made up of sophomores who had been in the program the first year (1964-65) as freshmen. A new class was formed for the occupational information group at the ninth grade (1968) freshmen level. Again, the instruction continued as before, students in the freshmen groups receiving approximately the same instruction which had been given to the freshmen and sophomore groups the year before. But, the sophomores were offered a more advanced program in occupational planning. This planning course consisted of further instruction of one class period per week followed by individual counseling of about one hour per month per student.

The second year (1965-66) of the research the juniors and seniors were again organized into a class for the coordinator's instruction. Those who had been in the senior class the year before (1964-65) most of whom had graduated, were out of school, unemployed, or working. Follow-up records were kept on them. Those who had been juniors the year before (1964-65) were seniors during the second year (1965-66) of the program and a new group of juniors were brought into the program during the second year (1965-66) of the research.

The instructional program brought into the classroom, ideas for holding and getting a job. During the early part of the course at the beginning of each fall semester, students were taken through this rather thoroughly so that they could get placed on the job as soon as possible. During the second year of the program, after the preliminary lessons, new instruction was introduced. The coordinator became involved in the process of developing two programs of

instruction one each for alternate years. This prevented considerable duplication for students who had been in the program before. However, the courses each year continued to present ideas on how to advance in one's occupation and how to locate new positions when one is terminated.

Throughout the three-year study the juniors and seniors, while in the cooperative vocational education program, were in the classroom one class period five days a week. In addition to getting occupational information and employment instruction these students spent part of the time learning about the occupation in which they were placed. The teacher-coordinator provided considerable literature of all kinds on jobs and families of occupations in which the students were engaged. This allowed each student individually to gain considerable information about the work he was doing in order to progress much faster than he could have done otherwise. Working more or less as apprentices with the help of related technical instruction of an organized nature these students had considerable guidance. Each student was charged with the responsibility of gaining a great deal of related technical information, and was constantly brought in contact with this kind of information. An organized study was made of the kinds and uses of many types of material and tools involved in the specific occupation held by the individual student.

During the entire study, the records of the students were kept up to date for comparative presentations. Each year a comparison of the enrollment by years was kept. This was done for the entire District No. 5 to show the trends in respective grade level enrollments. Records of dropouts and transfers were kept. Attention was given constantly to the students who were in the program and the change in the enrollment of these groups of people. Of course, the number of dropouts and the number of graduates and the number who transferred to other programs or to other schools were kept very accurately during the three years of the study.

During the third year of the study, classes were established in about the same manner as they were during the second year of the study. This involved two classes each for the freshmen and sophomore groups and one class for the cooperative vocational education group in each of the two high schools. Again there were both juniors and seniors in the cooperative vocational education class in each school. It must be kept in mind that there were actually two sections of the cooperative vocational education students, one located in the Tamms high school and the other located in the Thebes high school. For simplification of the study, however, these students were treated as one class representative of the entire Unit District No. 5, Alexander County.

It should be kept in mind that the purpose of this study was to find out whether two separate remedial practices would have any effect on the retention of high school students in Unit District No. 5. As has been mentioned before, these students were paired with other students in the school system who were not involved in the program. For each year of the study, there were four groups of students in the experimental group and four groups of students in the control groups. This is interpreted to say that at each grade level (9th, 10th, 11th, and 12th) there was (1) an experimental group and, (2) a control group. Further, it must be kept in mind that potential graduates and potential dropouts were scattered through all eight groups.

The experimental and control groups were selected on the basis of the scores on the two instruments developed for the identification of potential graduates and potential dropouts. Students were paired by scores and correlations were made of the scores to find out what degree of correlation existed between the scores of the control groups and the scores of the experimental groups. The statistical computation was made in two ways. The pairs were tested by the objective instrument scores and again by the subjective instrument

scores. The correlation coefficient in the former was approximately .974 for the groups studied and for the subjective instrument scores the correlation coefiicient was .978.

Another test was conducted to make sure that the students paired in the study were actually of the same character according to the scores on the two instruments. To make this study the sign test was used and the null hypothesis was tested. Again the two sets of scores were compared and it was accepted that there was no significant difference in the total scores of the X group when compared with the total scores of the Y group. The X scores represented the experimental group and the Y scores represented the control groups. The scores on both the objective and subjective instrument proved that there was no significant difference in the total scores of the X group when compared with the total scores of the Y group. Thus, the null hypothesis was accepted by both instruments used to measure the students in the program. The first interim report (March 1966) set up the details of the pairing procedure which was used in choosing the control and experimental groups for the study. See Appendixes A,B,C, and D for data on comparative scores on the control and experimental groups for the first year's study. These appendixes represents the method used for equating each subsequent class with a control group.

In this the final report, the comparison of the experimental classes and control groups are set up. Comparisons have been made of groups according to actual class and control group enrollments, giving special attention to potential graduates and potential dropouts in the program. In this way it was possible to show the relative success of the two experimental factors as they were applied to experimental groups of students.

To accept the hypotheses of this research study, students in the two programs would be more successful than those who were not in the programs.

"Success" in this study refers to the student who either continued in the program or graduated. An "Unsuccessful" student was one who dropped out of school and did not continue his education. The total number who were successful as compared to the total who were unsuccessful is the basis of the proof needed in this study to show whether one or both of the experimental factors would have any effect on the retention of students. The procedure was to show whether the predicted successful students were actually successful, more successful or less successful than the prediction. Another step in the procedure was to show whether students who were potential dropouts were actually unsuccessful as predicted or more successful or less successful than predicted.

Thus, the final report sets forth the comparison of all experimental groups and the control groups, being made up of both potential dropouts and potential graduates. The data contained information with respect to the number who transferred to another curriculum, the number who transferred to another school, the number who dropped from the program, and the number who continued in the program.

## Related Studies

Passow, Goldberg and Tannenbaunm report on a number of studies conducted among disadvantaged pupils in the United States. They dealt with both theoretical issues such as causes and more objective issues such as learning deficits as shown by tests. They dealt with widespread retardation in depressed areas and underscore the need for testing and evaluating new procedures. Particularly they have dealt with the urban youth, more especially those in slum areas. They present views regarding the need for more practical tests described as "culture fair" or "culture free". And they refer to observed patterns of difficulties of underpriviliged children trying to cope with school learning.[1]

Bernard Goldstein reports on urban areas. He raises the question: "Is unemployment basically a result of inadequate demand for goods and services, or the lack of appropriate skills - - - - - -". It is quite clear that among the low income youth there is a great need for providing appropriate skills. To do this it becomes necessary to provide motivating programs to raise skills as a means of improving the self-image. One could say also that the self-image

---

[1]Passow, Goldberg, and Tannenbaunm, Education of the Disadvantaged, New York: Holdt, Rinehart and Winston, Inc., 1967, viii + 503.

could be improved by creating confidence through developing saleable skills. In the search of identity, the adolescent needs to develop self-esteem, and among low-income families the motivations are not as great as among middle-or high-income families. To pull up the motivation level of children from low-income level families their aspiration to learn skills which will upgrade their situation in life must be met. The gap between aspirations and parental achievement must be realized and raised since this gap is somewhat low among disadvantaged youth.[1]

A National Education Association project, "Guidance and the School Dropout" cited reports which indicated that dropouts produce dropouts from one generation to the next. There were dropouts discovered among all types of high school curricula but the main characteristics of the dropout were: (a) reading retardation, (b) grade retardation, (c) low intelligence, (d) negative self-image, and (e) family attitudes. New approaches were suggested to retain in-school youth.

1. School-related adult education programs.
2. Job up-grading programs for workers.
3. Work-study programs.
4. "Return and graduate for dropouts" programs.
5. Compensatory education.
6. Kindergarten and early childhood programs.

Many suggestions were given for the identification of potential dropouts before they enter high school. These led to the consideration of many facets of the guidance program in meeting the potential dropout's needs. Outside resources and counseling were among these considerations as well as group procedures, testing, occupational information, placement and follow-up.[2]

---

[1]Bernard Goldstein, Low Income Youth in Urban Areas, New York: Holt, Rinehart and Winston, Inc., 1965, viii + 280.

[2]National Education Association, Guidance and The School Dropout, Washington, D.C., 20036, 1964, (Daniel Schreiber and Bernard A. Kapplan, Coeditors) viii + 267.

Another project, "School Dropouts", by the National Education Association identified four types of low-income dropouts: (a) school-inadequate, (b) school-rejecting, (c) school-perplexed, and (d) school irrelevant. "Contrary to common beliefs, dropouts are not exclusively from working class and lower class or low income families." Another significant contribution was that the middle-class dropout is often overlooked in needs studies. Similarly, the socially and economically deprived graduate is often overlooked. Neither of the latter groups have been identified in categories or classified into "types". This report recommends that studies be made of all economic levels of dropouts. It further underlines the fact that dropouts are a heterogeneous group and represent a rather normal sample.[1]

## CHAPTER II

## THE INSTRUMENTS

In order to determine whether they were potential graduates or potential dropouts, all students in the program were measured by the two instruments mentioned in Chapter I. These instruments were developed earlier by a study during the summer of 1964 in which the instrumentswere validated and proved reliable to a very high degree. Figure 1 sets forth the objective instrument used to collect data for our records. The reliability correlation coefficient for this instrument was .815. In other words, the correlation between the students who graduated and the students who dropped out of school measured by the objective instrument with scores which proved a very high degree of reliability in predicting the graduate or potential dropout. Table 1 shows the objective scores on this instrument and its relative degree of predictiveness. For this study it may be noted that a score of plus 7 or higher would identify the dropouts rather satisfactorily. It identified 98.4 per cent of the dropouts while falsely identifying only 11.1 per cent of graduates. A score of plus 7 or higher on the objective instrument selected to identify the potential dropout by this instrument.

Figure 2 presents the subjective instrument. It was designed for studying the potential dropout and the potential graduate also. The reliability correlation for this instrument was .845. A score of 16 or higher correctly identified 92.9 per cent of the potential dropouts, whereas this score identified falsely 7.1 per cent of the graduates. The score of 16 or higher was used, therefore, to identify by this instrument the potential dropouts.

sought by the subjective instrument's application. The researchers reviewed very frequently the use of instructions and practiced frequently, with subjects, in administering them.

The objective data were much easier to collect than the subjective data because in most cases they were located in the principals' offices of the schools involved. Some students could not be identified as potential dropouts or potential graduates by the objective instruments because their records were incomplete or not available in the principals' offices. In such cases the subjective instrument was used. Whenever this had to be done, the student was visited in his home by a researcher who was fortified to get the information specified in the subjective instrument by talking with the subject and his parents.

## CHAPTER III

## THE PRESENTATION OF DATA

### For The Egyptian District

Table 3 gives a comparison of the dropout and the graduate data for the entire school district. It will be noted that among the 1966 graduating class the number of dropouts was greater than any on the record kept for this study. Since all students in the school had been identified according to dropouts and potential graduates, it was possible to show the dropout rate among the potential graduates as well as the potential dropouts. Table 3 shows very definitely that the predicted potential dropout group, did in fact, loose more students than the potential graduate group did.

Figure No. 3 shows the relationship between the dropouts, graduates, and transfers according to years in which the study was made. Actual graduates and actual dropouts as well as transfers are indicated for the grade year 1965, 1966, and 1967. For the potential scholastic graduates and dropouts for grade years 1968, 1969, and 1970, the numbers are projected on the basis of the records on hand at the time the study was completed. It will be noted that there was a slight improvement in the number of students who graduated from Egyptian Unit School District No. 5, in Alexander County. This may have been due partially to the fact that the cooperative vocational education program was initiated and vocational counseling and occupational information was provided beginning with the fall semester of 1964 and extending through the spring semester of 1967.

A comparison by years of respective grade enrollments of potential graduates and potential dropouts for Egyptian District is presented in Figure 4. Figure 4 is based partially on the predictability of the instruments for the

NOTE: Solid Lines represent predicted graduates.
A Dotted Line represents predicted dropouts.
Data for classes of 1965 and 1966 are complete and show the actual success of the total group was greater than predicted. It may be assumed that this was due to part to the introduction of the experimental programs.
Students identified by the objective instruments.
(*) Actual data includes both potential graduates and potential dropouts.

years 1970, 1969, and 1968. It has been pointed out earlier that in identifying some 98 per cent of the potential dropouts, one would misidentify 10 per cent or less of the potential graduates. Figure 4, therefore, shows the graduate group somewhat lower than it actually turned out to be in the grade years 1965, 1966, and 1967. It might be repeated that perhaps the "Experimental and Demonstration Project" did have an effect on the retention of students in Unit District No. 5.

Figure 4 indicates that the 1970 grade year enrollments include 50 per cent potential graduates and 50 per cent potential dropouts. It is required that this group show an increase in actual and potential graduates when a corresponding decrease is shown in the actual and potential dropouts. Hence, the corresponding graphs are distributed equi-distance from the 50 per cent position. There is no special significance to the fact that 1970 grade-year group of students were distributed about equally. The 1970, 1969, and 1968 groups are predictions made according to the measurement of the objective and/or subjective instruments of identification. There has been found some misidentification in both instruments, and the numbers of graduates and dropouts have varied considerably within past years among the grade years. However, it should be observed that considerable improvement was affected within the grade years of 1965, 1966, and 1967.

Since both instruments measured fairly well both the potential dropouts and the potential graduates, it was interesting to see what the large or more important differences were. It was noted that the families of the potential dropouts were much larger, often having twice as many children per family as compared to families of the potential graduates. The days absent per academic year were about twice as great among the potential dropouts as compared to those

TABLE 4

| Total Unsuccessful | 8 | 15 | 21 | 39 |
| Total Potential Dropouts | 54 | 100 | 55 | 100 |

among the potential graduates. Among the potential graduates, high school grade-point averages were about twice as great as the grade-point averages among the potential dropouts. The potential dropouts participated in about half as many extra-curricular activities as the potential graduates.

For The Project

Appendixes G and H illustrate the distribution of the scores of the experimental and control groups in the two remedial programs by items on the objective instrument only. Similar score distributions were produced for students who had been identified only by the subjective instrument. This group was small, however.

Table 4 sets up a study of potential graduates and potential dropouts among the total of both the experimental and control groups of freshmen. Table 4 contains all of the students in the 1964-1965, 1965-1966 and 1966-1967 program of occupational information and vocational counseling for freshmen. From the data presented in this table it may be observed that the control group began to perform according to prediction. In other words, a large percentage of the students in the potential dropout group were actually leaving school before the completion of the tenth grade. This grade period represents the chronological approach of the sixteenth birthday. Also significant in Table 4 is the fact that among the total in the experimental group of potential dropouts, a higher percentage were successful than among the control group. In other words, among the potential dropouts the retention was higher in the experimental group which received occupational information and vocational counseling. To a lesser degree, potential graduates in the experimental group had fewer unsuccessful students than those in the control group. Percentage wise this was a comparison between 96 per cent who were successful in the experimental

group and 85 per cent who were successful in the control group. Another significant thing which should be noted is that the students who were listed as potential dropouts were not all through the four-year program at the point of this presentation. Consequently, many of the potential dropouts will, in fact, drop out later as they progress into the sophomore, junior, and senior years of high school. The information gathered in Table 4 refers only to the freshmen class by groups and does not involve the sophomore class in occupational information and vocational counseling.

For the Occupational Information and Vocational Counseling Class I (freshmen) a study of significance was made. Blocking in the successful and unsuccessful with the experimental and control groups, a Chi Square study was made as follows:

OCCUPATIONAL INFORMATION AND VOCATIONAL COUNSELING CLASS I (Freshmen)
Chi Square

| | Successful | Unsuccessful | Total |
|---|---|---|---|
| Experimental Group | A = 73 | B = 8 | 81 |
| Control Group | C = 56 | D = 25 | 81 |
| | 129 | 33 | 162 = N |

$$x^2 = \frac{N\ (AD - BC) - \frac{N^2}{2}}{(A+B)\ (C+D)\ (A+C)\ (B+D)}$$

$$x^2 = \frac{162\ (73)\ (25) - (8)\ (56) - \frac{162^2}{2}}{(73+8)\ (56+25)\ (73+56)\ (8+25)}$$

$$x^2 = 9.74$$

These data are significant to the one per cent level or better and accept the hypothesis: <u>If potential dropouts under 16 years of age, were taught about</u>

TABLE 5

COMBINED TOTAL ENROLLMENTS FOR SOPHOMORES IN THE 1965-1966 AND 1966-1967 OCCUPATIONAL INFORMATION AND VOCATIONAL COUNSELING CLASS II (SOPHOMORES) BY GROUPS WHERE P/Gs = 100% AND P/D = 100%

| | Experimental Group | | Control Group | |
|---|---|---|---|---|
| | Number | Percent | Number | Percent |
| Continued in Program | 5 | 29 | | |
| Transferred to Another Curriculum | 9 | 53 | | |
| Total Continuing | 14 | 82 | 9 | 53 |
| Transferred to Another School | 2 | 12 | 3 | 18 |
| Graduated | 1 | 6 | 1 | 6 |
| Total Transfers and Graduates | 3 | 18 | 4 | 24 |
| Total Successful | 17 | 100 | 13 | 77 |
| Dropped | 0 | | 4 | 23 |
| Total Unsuccessful | 0 | | 4 | 23 |
| Total Students | 17 | 100 | 17 | 100 |

occupations and given individual vocational counseling periodically, they would stay in school longer.

For Occupational Information and Vocational Guidance Class II, (sophomores), a similar study was made. Table 5 shows the data which was collected on this group. Although the numbers are much smaller here, the same procedure was followed as in the Occupational Information and Vocational Counseling Class 1 (freshmen). Again, Table 5 substantiates the hypothesis that this kind of instruction was good to retain students. A study of the significance was made for this group of data also. The presentation of the Chi Square study follows:

OCCUPATIONAL INFORMATION AND VOCATIONAL COUNSELING CLASS II (Sophomores)
Chi Square

| | Successful | Unsuccessful | Totals |
|---|---|---|---|
| Experimental Group | A = 17 | B = 0 | 17 |
| Control Group | C = 13 | D = 4 | 17 |
| | 30 | 4 | 34 = N |

$$x^2 = \frac{N\ (AD - BC) - \frac{N^2}{2}}{(A+B)\ (C+D)\ (A+C)\ (B+D)}$$

$$x^2 = \frac{34\ (17)\ (4) - (0)\ (13) - \frac{32^2}{2}}{(17+0)\ (13+4)\ (17+13)\ (0+4)}$$

$$x^2 = 2.55$$

Again the significance of this study was found to be reliable to the one per cent level of significance. It should be noted that the occupational information and vocational counseling class for sophomores was not organized as such for the first year of the study. Hence, the total numbers are smaller.

TABLE 6

COMBINED TOTAL ENROLLMENTS FOR JUNIORS AND SENIORS IN THE 1964-1965, 1965-1966 AND 1966-1967 GRADUATING GRADES

COOPERATIVE VOCATIONAL EDUCATION CLASS BY GROUPS

WHERE P/G's = 100% AND P/D's = 100%

| | Experimental Group | | Control Group | |
|---|---|---|---|---|
| | Number | Percent | Number | Percent |
| POTENTIAL GRADUATES | | | | |
| Continued in Program | 6 | 12 | | |
| Transferred to Another Curriculum | 3 | 5 | | |
| Total Continuing | 9 | 17 | 2 | 4 |
| Transferred to Another School | 2 | 4 | 2 | 4 |
| Graduated | 40 | 77 | 35 | 72 |
| Total Transfers and Graduates | 42 | 81 | 37 | 76 |
| Total Successful | 51 | 98 | 39 | 80 |
| Dropped | 1 | 2 | 10 | 20 |
| Total Unsuccessful | 1 | 2 | 10 | 20 |
| Total Potential Graduates | 52 | 100 | 49 | 100 |
| POTENTIAL DROPOUTS | | | | |
| Continued in Program | 4 | 9 | | |
| Transferred to Another Curriculum | 2 | 4 | | |
| Total Continuing | 6 | 13 | 4 | 8 |
| Transferred to Another School | 2 | 5 | 1 | 2 |
| Graduated | 31 | 69 | 9 | 19 |
| Total Transfers and Graduates | 33 | 74 | 10 | 21 |
| Total Successful | 39 | 87 | 14 | 29 |
| Dropped | 6 | 13 | 34 | 71 |
| Total Unsuccessful | 6 | 13 | 34 | 71 |
| Total Potential Dropouts | 45 | 100 | 48 | 100 |

Furthermore, this number was small because fewer students were able to schedule the second year of the occupational information and vocational counseling. In other words some were deprived the second year of the program, simply because they could not schedule it. Regardless, Figure 4 illustrates the point that potential graduates did have considerable success over the potential dropouts among the few studied.

Table 6 presents data for the cooperative vocational education class by groups where the potential graduates equal 100 per cent and the potential dropouts equal 100 per cent. Table 6 also presents the combined class total enrollments for the scholastic years ending 1965, 1966, and 1967. Again, it may be observed that the potential graduates were quite successful in the program. However, among the control group of potential graduates there was not as much success as was shown among the experimental group of the potential graduates. More significantly, among the potential dropouts, the total success was much greater in the experimental group than among the control group. The effect of moving the Tamms cooperative vocational education program from the Tamms high school to the Thebes high school accounted for only one student transferring out of the program so that he could stay at the Tamms high school during the 1967-68 scholastic year.

Again the Chi Square study of reliability was made of the data on Table 6. The presentation follows:

COOPERATIVE VOCATIONAL EDUCATION GROUP

Chi Square

| | Successful | Unsuccessful | Totals |
|---|---|---|---|
| Experimental Group | A = 90 | B - 7 | 97 |
| Control Group | C = 53 | D - 44 | 97 |
| | 143 | 51 | 194 - N |

Students Study the Job Inside School and Practice It Outside

FIGURE 5

THE RETENATIVE VALUES OF THE

COOPERATIVE VOCATIONAL EDUCATION PROGRAM

$$x^2 = \frac{N\ (AD - BC) - \frac{N^2}{2}}{(A+B)\ (C+D)\ (A+C)\ (B+D)}$$

$$x^2 = \frac{194\ (90)\ (44) - (7)\ (53) - \frac{194}{2}}{(90+7)\ (53+44)\ (90+53)\ (7+44)}$$

$$x^2 = 34.3$$

Reliability to the one per cent (or lower) level of significance was maintained again. It must be accepted that: <u>If potential dropouts, over 16 years of age, were provided vocational counseling and cooperative vocational education they would stay in school longer</u>.

The data seemed to be very effective in exposing that the successful students were by and large in the experimental group. Among this group there was a considerable number of potential dropouts. In the "Second Interim Report", it had become apparent that students progressing through the experimental programs from the freshmen through the senior years had a tendancy to stay in school longer. This became more obvious as the study continued through the third year. The potential dropouts in the programs had a tendancy to continue in occupational information, vocational counseling, and cooperative vocational education classes. Even among the potential graduates the number of transfers to other curricula in the schools was zero. Among the potential graduates the number of successes were greater in the experimental group than in the control group. It was significant that one potential graduate did drop out of the experimental group. Overbalancing this was the fact that among the experimental group the successes were exceedingly high when compared to the successes in the control group.

Figure 5 represents the graphic illustration of comparative groups and the success factor as proven by the above data.

Follow-up Data on the Cooperative Vocational Education Groups

During the time the cooperative vocational education students were in school, they held various types of vocational occupations on the job part-time while attending school. A list of the occupations held by the cooperative vocational education students is as follows:

Farm Machinery Repairman
Beauty Operator Assistant
Secretary
Wood Chopper
Farm Mechanic
Building Service Worker
Switch Board Operator
Funeral Attendent
General Farm Hand
Auto Body Repairman
Auto Mechanic Helper
Meat Cutter Apprentice
General Office Clerk
Laundry Hand

FIGURE 6

Salesman, Building and Construction Equipment and Supplies
Ward Clerk
Farm Manager
Auto Partsman
Electrical Appliance Repairman
Salesperson, Parts Counterman
Maintenance, Hospital
Lab Assistant
Janitor
Cook, School Cafeteria

After graduation from high school or leaving high school, the experimental students held better jobs generally than the students in the control group. Figure 6 illustrated the various types of positions held by the two groups after leaving school. It may be observed that no student among the experimental group was unemployed; that positions held were of higher rank generally than those held by the control group. Very few of the experimental group continued into other programs of learning. This points up the fact that a need was met by the experimental program.

Figure 7 gives more follow-up data on the cooperative vocational education students. It may be noted that all groups predominately locate in Illinois. The "area" of Figure 7 refers to the immediate county in which the students were schooled, this being Alexander County. The designation "Illinois" represents other parts of Illinois in which the students found employment. Consequently, the "area" and "Illinois" claimed most of the graduates and the dropouts. Very few moved out of state to find employment. Both experimental and control groups were employed in cities rather small in size. A very few were employed in metropolitan areas and a few in the rural areas.

## Some Observations

The researchers were in constant contact with the teacher-coordinator in the program. During the first year much recruiting was needed to get a sizeable class of cooperative vocational education students. During the

FIGURE 7

FOLLOW-UP OF THE EMPLOYER LOCATION — TYPE OF

COMMUNITY OF THE COOPERATIVE VOCATIONAL EDUCATION STUDENTS

(Percentages)

second year not much recruiting was needed. During the third year no recruiting at all was made among students in the school and community. By that time the program was well known and students were clamoring to get into it. As the study neared completion, more students were applying to get in the cooperative vocational education program than could be accomodated. This applied to both the Tamms, Illinois high school and the Thebes, Illinois high school.

Students were not very disturbed at having to take a work station in fields of second or third choice. Such placement did not cause frustrations. Some seemed highly satisfied after being placed and requested a continuation in the second-choice work training. Most students looked upon the coop program as an opportunity to learn responsibilities and dependable traits rather than specific skills.

In each of the high schools there were clubs formed in connection with the cooperative vocational education programs. This club arrangement was affiliated with the Vocational Industrial Clubs of America. Generally speaking, the club meetings were well attended and much discussion took place. In some instances, the time was given largely to more activity, program planning, and the establishment of extra-curricular programs. The extra-curricular programs included parties, banquets, field trips, and the like.

The programs of cooperative vocational education became rather selective during the last two years, because there were more students available and willing to sign up for the programs. Selections had to be made. The selections were based on the need rather than on the basis of likely success. As a result, the best students for the program may have not been selected, but rather those who may have needed it most were selected. The philosophy here was based on the thought that it was better to do the most for those who needed it most.

Attitude was one of the greatest problems to overcome in the cooperative vocational education classes. Attitudes were hard to evaluate because of the students inability to express himself and his unwillingness to enter into discussions where personal problems were involved. Many students showed embarrasment about their background and home living conditions. Poverty and the lack of good clothes often kept students from having good attitudes. Many in the program had very poor abilities when it came to speaking before the group. This was noted particularly in an affair when the students were suppose to introduce their employer at a local cooperative vocational education banquet. Some students stayed away from the banquet merely because they knew they were expected to introduce their supervisor or employer. Another very significant observation was that when students left school in the afternoon to work on the job, transportation time often interferred with many things. For example, a student was unable to get to work very early in the afternoon, and his transportation from work to home oftentimes caused him to be very late in the evening. Evening activities were, therefore, curtailed considerably. This probably accounted for some of the students not being able to do a great deal of homework assigned by the high school teachers. This brought complaints from the teachers.

In the selection of students, it was the policy in one school to prohibit students with an average grade of above a "C" to enter the program. This requirement expressed a philosophy of this particular school or the school administration in denying many of the students with higher abilities the freedom to enter the program. It seemed that the philosophy expressed was: "Students who are earning a "C" or above should be considered college bound and, therefore, discouraged from entering a terminal program such as the cooperative vocational education program." Scheduling conflicts made it impossible for some needy students to get in the program.

The teacher coordinator reported that it was much easier to find employers willing to provide training stations than it was to get the same employers to hire some students interested in the job involved. None-the-less, it was noted that all students who were outgoing and friendly, usually made the correct approach and were hired early in the scholastic year. Each had some difficulty in the interview convincing the employer that he was a willing worker. The retiring and reticent students had more difficulty in this regard.

The general occupational related information teaching in the related subjects class was probably held behind the ability of some students in the program. This was due to the fact that many students had very low reading ability and were unable to absorb the instruction as fast as might have been expected. The coordinating teacher reported that supervisors records were not entirely reliable, because in many instances the supervisors on the job did not understand the grading system or rating system which is normally understood by teachers. Hence, the coordinator had to develop a five point evaluation scale rather than a letter grade or percentage grade to be used in evaluating students progress. Finally, the five point scale instrument allowed the coordinators and on-the-job supervisors to prepare a profile chart from time to time showing the student's progress. (See Appendix I)

Among the students in the program, it was generally recognized that there would be no opportunity to go on to college. This may have been caused in one school by the administration not allowing students who had a "C" average or above to enter the program. After entering the cooperative vocational education program over 15 per cent of the students made the honor roll for the first time in their careers. This should indicate that the program met certain needs undiscovered heretofore.

One of the problems of the teacher-coordinator was finding openings or training stations to meet the interest needs of students in his classes. Very few of the students, once they were placed, requested to be moved because of disastisfaction on the job or with the program at school as it affected their progress in education. Most of the students were very pleased to be in the program and would not transfer out of it regardless of the disastisfactions which often occured on the job. Very few of the students were found unreliable. Some unreliability was discovered. However, almost all of the students made adjustments to their problems and overcame some of the temptations and difficulties which they had in dealing with their employer, his associates and customers.

A follow-up of persons who transferred to another curriculum disclosed several causes for the transfers. There were five such students and the reasons given were also five. They follow:

1. Athletic participation.
2. Could not be trusted as a reliable worker.
3. Poor attitude and could not hold a job.
4. Parents objected because of late return home from work.
5. Would not change schools to follow program (1967-68).

## CHAPTER IV

## GENERALIZATIONS

Although this three-year study has involved a relatively small group of cases, it appears that a great deal of significance should be attributed to it. One might contend that a larger group of students might have given more reliable results or that the study should have been applied over a longer period of time in order to get further proof of reliability. However, the study has shown definitely that the experimental factors were successful in the retaining of students in the schools of Tamms, Illinois and Thebes, Illinois.

The selection of students for the study was done rather scientifically. The relationships between the control and experimental groups as shown by statistics were very convincing. The experimental groups were not significantly different from the control groups. Consequently, the experimental factors seem to be the only justified influence in the performance of experimental and control groups.

A longer longitudinal study would probably show even still better performance among experimental groups of the future. It is believed that this would be especially true if the programs could be continued over a longer period of time in the high schools of Tamms, Illinois and Thebes, Illinois.

When this program was initiated, students had to be "sold" on the idea, but as the program progressed, less and less contacts had to be made in order to achieve the required or necessary enrollments to produce sizeable classes.

One cannot overlook the fact that the two experimental programs did have effect on the number of actual dropouts. Much progress has been shown in this program over the past three-years. The values of the two experimental programs were quite apparent.

In the considerate judgements of the researchers, it is believed that the hypotheses stated in Chapter I have been proved. Occupational information and vocational counseling of students under 16 years of age had retentative values for students in the Tamms, Illinois high school, 1964 to 1968. To a much higher degree, cooperative vocational education of the interrelated type had a considerable effect in the retention of students at the junior and senior levels of the high schools at Tamms, Illinois and Thebes, Illinois. Students have developed better habits and attitudes; better personalities have been developed; and the placement of students who satisfactorily complete a cooperative vocational education program terminating with high school graduation is almost assured. Almost all graduates of the cooperative vocational education program were prepared for work and seemed successful.

One thing which has not been done in this study is to determine whether a student who took training in a given occupation actually followed that occupation after high school graduation. In the beginning, it was not the purpose of cooperative vocational education to develop people for specific skills and employment but rather to give general vocational experience working on the job to see if this would retain students. This was justified because it was thought students could make adjustments and get prepared for families of jobs as an incentive to complete high school. The purpose of the program was to provide general occupational information and general occupational experience rather than specific trade and industrial or other vocational and technical education. The program was exploratory in the sense that it was vocational exploration rather than any other type of exploration. It cannot be overlooked

that the selected students were able to explore many facets of the work-a-day world. Similarily, it cannot be overlooked that general education as well as vocational education was provided.

Any cooperative vocational education program should be supported by a program of vocational counseling. This should include general occupational information, general related technical education and specific technical related information. Individual vocational counseling should give particular attention to the socio-economical level of the student involved. The vocational counselor and the coordinator (if different personalities) should be highly competent people. The success of this research has been due largely to the careful selection of such personnel for the assignment of these tasks.

Hypotheses Accepted

1. If potential dropouts under 16 years of age were taught about occupations and given industrial vocational counseling periodically, they would stay in school longer than they would otherwise.
2. If potential dropouts over 16 years of age were provided vocational counseling and a cooperative vocational education (interrelated programs) they would stay in school longer than they would otherwise.

[1]Exp. = Experimental Group

[2]Cont.= Control Group

Note: Above data arranged for use in the Pearson Product-Moment formula.

Statistical Computation From Above Data:

$$\text{Formula} = r_{xy} = \frac{N\Sigma XY - (\Sigma X)(\Sigma Y)}{\sqrt{[N\Sigma X^2 - (\Sigma X)^2][N\Sigma Y^2 - (\Sigma Y)^2]}}$$

The value for substitution are:

$$N\Sigma XY = (27)(2565) = 69255$$

$$(\Sigma X)(\Sigma Y) = (245)(241) = 59045$$

$$N\Sigma X^2 = (27)(2613) = 70551$$

$$(\Sigma X)^2 = (245)^2 = 60025$$

$$N\Sigma Y^2 = (27)(2551) = 68877$$

$$(\Sigma Y)^2 = (241)^2 = 58081$$

Substituting in the formula:

$$r_{xy} = \frac{69255 - 59045}{\sqrt{(70551 - 60025)(68877 - 58081)}}$$

$$r_{xy} = \frac{10210}{\sqrt{(10526)(10796)}}$$

$$r_{xy} = \frac{10210}{24380.4} = .958$$

The correlation coefficient of r = .958 is extremely high and shows a very slight difference between the matched pairs according to the objective instrument scores. (See Appendix A)

APPENDIX B

Note: Pairs Tested By Subjective Instrument Scores

(See Appendix B)

| 24 | T328-T319 | 28 | 30 | 840 | 784 | 900 |
| 25 | T235-T226 | 18 | 21 | 378 | 324 | 441 |
| 26 | 419- 406 | 19 | 20 | 380 | 361 | 400 |
| 27 | 314-T308 | 32 | 30 | 960 | 1024 | 900 |
| | Total | 535 | 534 | 11460 | 11531 | 11438 |

[1]Exp. = Experimental Group

[2]Cont. = Control Group

Note: Above data arranged for use in the Pearson Product-Moment formula.

Statistical Computations From Above Data:

$$\text{Formula} = r_{xy} = \frac{N\Sigma XY - (\Sigma X)(\Sigma Y)}{\sqrt{[N\Sigma X^2 - (\Sigma X)^2][N\Sigma Y^2 - (\Sigma Y)^2]}}$$

The value for substitutions are:

$N\Sigma XY = (27)(11460) = 309420$

$(\Sigma X)(\Sigma Y) = (535)(534) = 285690$

$N\Sigma X^2 = (27)(11531) = 311337$

$(\Sigma X)^2 = (535)^2 = 286225$

$N\Sigma Y^2 = (27)(11438) = 308826$

$(\Sigma Y)^2 = (534)^2 = 285156$

Substituting in the formula:

$$r_{xy} = \frac{309420 - 285690}{\sqrt{(311337 - 286225)(308826 - 285156)}}$$

$$r_{xy} = \frac{23730}{\sqrt{(25112)(23670)}}$$

$$r_{xy} = \frac{23730}{24380.4} = .973$$

Again the high correlation indicates very little difference between matched paris according to the subjective instrument scores. (See Appendix B)

# APPENDIX C

Note: Pairs Tested By Objective Instrument Scores

(Sign Test)

| No. | Pairs | X | Y | Sign |
|---|---|---|---|---|
| 1 | 322-T338 | 4 | 4 | 0 |
| 2 | 420-T422 | 10 | 10 | 0 |
| 3 | 413-T401 | 7 | 5 | + |
| 4 | 404-T415 | 12 | 11 | + |
| 5 | 425-T411 | 7 | 9 | - |
| 6 | 325-T304 | 5 | 5 | 0 |
| 7 | 426-T417 | 4 | 3 | + |
| 8 | 310-T303 | 12 | 11 | + |
| 9 | 407-T416 | 12 | 12 | 0 |
| 10 | 405-T413 | 2 | 4 | - |
| 11 | 401- 411 | 18 | 18 | 0 |
| 12 | 318-T345 | 10 | 8 | + |
| 13 | 311- 307 | 8 | 8 | 0 |
| 14 | T334-316 | 17 | 18 | - |
| 15 | T302-305 | 5 | 6 | - |
| 16 | T337-309 | 7 | 6 | + |
| 17 | T318-327 | 9 | 8 | + |
| 18 | T312-301 | 8 | 10 | - |
| 19 | T402-410 | 5 | 5 | 0 |
| 20 | T324-319 | 10 | 9 | + |
| 21 | T316-302 | 11 | 11 | 0 |
| 22 | T427-402 | 7 | 6 | + |
| 23 | T301-342 | 8 | 8 | 0 |
| 24 | T328-319 | 11 | 11 | 0 |
| 25 | T235-226 | 15 | 15 | 0 |
| 26 | 419-406 | 11 | 12 | - |
| 27 | 314-T308 | 10 | 8 | + |

Lowest No. differing = X = Number of pluses = 10, Number of minuses = 6 } 16 = N (having differences)
Number of ties = 11

The significant numbers here are 16 (N = 10 + 6 the number of pairs with differences) and 6 (X = the lowest No. differing).

In this case, N equals 16 and X equals six. Statistical tables shows probabilities of .22 for a one-tailed test, and .44 for a two-tailed test for N equals 16 and X equals six. Since the value .44 exceeds .05 (the level of significance established for this study) one must accept the null hypothesis.

Accepted: *There is no significant difference in the total scores of "X" group when compared with the total scores of the "Y" group.*

# APPENDIX D

## Pairs Tested By Subjective Instrument Scores

(Sign Test)

| No. | Pairs | X | Y | Sign |

| 12 | 318-T345 | 19 | 17 | + |
| 13 | T311-307 | 22 | 21 | + |
| 14 | T334-316 | 28 | [illegible] | - |
| 15 | T302-305 | 11 | 12 | - |
| 16 | T337-309 | 21 | 20 | + |
| 17 | T318-327 | 19 | 19 | 0 |
| 18 | T312-301 | 20 | 20 | 0 |
| 19 | T402-410 | 11 | 11 | 0 |
| 20 | T324-319 | 18 | 18 | 0 |
| 21 | T316-302 | 23 | 23 | 0 |
| 22 | T427-402 | 22 | 19 | + |
| 23 | T301-342 | 28 | 25 | + |
| 24 | T328-319 | 28 | 30 | - |
| 25 | T235-T226 | 18 | 21 | - |
| 26 | 419-406 | 19 | 20 | - |
| 27 | 314-T308 | 32 | 30 | + |

Lowest No. differing = X = Number of pluses, Number of minuses, Number of ties } 13 = N (having differences)

The significant numbers here are 13 (N = 6 + 7 the number of pairs with differences) and 6 (X = the lowest No. differing).

In this case, N equals 13 and X equals six. Statistical tables show probabilities of .50 for a one-tailed test, and 1.-- for a two-tailed test for N equals 13 and X equals six. Since the value 1.00 exceeds .05 (the level of significance established for this study) one must accept the null hypothesis again.

# APPENDIX E

## GENERAL INSTRUCTIONS FOR USE OF THE OBJECTIVE INSTRUMENT

Before adapting this instrument to a specific locality, it must be validated for the particular school and community. The validation of the instrument is easily accomplished by selecting at random previous graduates and dropouts and testing them with the instrument. Final validation of the instrument is determined by the individual and total biserial correlations.

Use state or national norms for test data in Items 3, 4, and 6.

Items 7-12 might require personal interviews with child or parents.

The student's total score is determined by adding the numerical weights assigned to each item at the right of the form.

### Item Content Instructions

Item 1

Grade Retardation - (If the records for grade retardation are incomplete, use the following method)

a. List the calendar year in which last grade was completed.

b. Subtract calendar year of birth.

c. Subtract age in year started first grade.

d. Subtract last grade completed.

Example:

| | |
|---|---|
| 1960 | year last grade completed |
| 1948 | date of birth (year) |
| 12 | age at last grade completed |
| -6 | age started first grade |
| 6 | intended grade placement |
| -5 | last grade completed |
| -1 | grade retardation |

Item 2

Circle the total number of days absent during the 7th and 8th grades.

Items 3, 4, and 6

Circle either the California Achievement Test score or the Iowa Test Score Percentile Rank.

Item 5

Circle the number of extracurricular activities in which the student participated.

Item 7

Circle the number of older brothers and sisters.

Item 8

Circle the number of younger brothers and sisters.

Item 9

Circle the economic status.

Item 10

Classify the father's occupation by the categories listed in the Dictionary of Occupational Titles.

| Occupations, | D. O. T. Classifications | Rating |
|---|---|---|
| Sales | 1-5 through 1-9 | |
| Managerial | 0-7 through 0-9 | |
| Technical | 0-4 through 0-6 | Score -3 |
| Professional | 0-0 through 0-3 | |
| Agriculture | 3-0 through 3-9 | Score -1 |
| Semi-skilled | 6 and 7 | |
| Skilled | 4 and 5 | |
| Clerical | 1-0 through 1-4 | Score 0 |
| Service | 2-0 through 2-9 | |
| Unskilled | 8 and 9 | Score +2 |

Item 11

Circle the number of feeder schools attended.

Item 12

Circle with whom the child is living. If living with both parents leave blank.

Place the numerical weights for each item under the "Total" column and add.

# APPENDIX F

## SPECIFIED RATINGS FOR THE SUBJECTIVE INSTRUMENT

A. The Home-Living Conditions

0 - Large. Evidence of constant and expert maintenance. Very modern fixtures and/or in very correct taste with respect to its style. Clean. Expertly landscaped.

1 - Moderately sized. Well kept. Modern fixtures. Good taste in style. Well furnished. Attractive grounds and exterior.

2 - Medium size. Neat and clean. Needs some maintenance. Fairly well furnished. Modern facilities. No special exterior care or grounds improvement.

3 - Unfavorable housing. Might have inside toilet. Serviceable but run down. Inadequately furnished. Generally neglected inside and out.

4 - Almost unliveable. Unserviceable. Outside toilets. Junky furniture. Poorly kept and unclean.

B. Attitude Towards Education - School

0 - Very favorable towards school. Seems to be apologetic about school's shortcomings. Is a booster.

1 - Generally favorable. Inclined to be critical of some facets, and points a finger at others who are to blame. Is generally pleased with experiences at school.

2 - No comment, generally. Stays out of or doesn't actually become a part of school life.

3 - Does not like school generally. Feels that there are several more worthwhile things than an education. Looks forward to dropping formal education.

4 - Feels that school is a complete waste of time. Wants to drop. Hates school.

C. Attitude Towards School Authority

0 - Accepts authority without question. Believes in authority and that it has a purpose. Wants to act in accordance with authority.

1 - Accepts authority for authority. Has resentments but keeps out of trouble by following authority. Would violate authority at times for the thrill of it or to gain recognition. Respects authority.

2 - Generally accepts authority but has no high regard for it. Wants to be left alone. Knows authority is a need in our society.

3 - Generally rejects authority. Seems to have fears of authority even though he recognizes its purpose.

4 - Hates all authority. Tries to "outsmart" those in authority. Rejects authority anywhere anytime because it is authority.

D. Attitude Towards Work, Earning a Living, Training for a Job, etc.

0 - Respects those who work and earn a living. Wants to prepare for his share of responsibilities in the world-of-work society. Is eager to work and earn. Wants to train or prepare himself for responsible work. Wants to be given a chance to prove himself.

1 - Has most of the above characteristics without the eagerness. Wants to become informed as to the requirements for work.

2 - Wants a job but is apprehensive about getting and holding one. Seems to question his aptitude or capacity for responsible work. Is anxious to find out. Will seek help.

3 - Would take a job if it is offered him. Not too willing to enter a long-term training program. Would take a "blind alley" job without a question as to the future. Lack of responsibility in his workmanship.

4 - Sees no need for work. "The welfare check will supply my needs."

E. Ability to Communicate with Others

0 - Excellent use of English. Expresses self very well. Asks intelligent questions. Enjoys discussions.

1 - Good use of English. Expresses self well. Is not especially responsive to questions or in raising questions. Has no trouble in expressing his opinions when issues are raised by others. Speaks freely and easily.

2 - Fair use of English. Talks freely and is able to express himself even though somewhat awkardly at times. Is not strong in an argument.

3 - Poor use of English but is able to communicate with others. Has difficulty in expressing himself clearly and is sometimes misunderstood. Generally avoids intelligent conversations.

4 - Poor use of English. Unable to communicate well with others. Limited use of words. Avoids discussions because he is frequently misunderstood.

F. Poise

0 - Very much at ease and relaxed. Seems unshaken and composed in almost any situation. Speaks well under stress. Actions and words seem deliberate and well planned.

1 - Looks composed and at ease and is generally in control of his emotions. In speaking under strain his voice may indicate stresses. Is able to recover and make a good showing regardless.

2 - Apparently at ease and composed most of the time. When shaken by stress or emotional disturbances, his voice and actions may change. More noticeable than in #0 & 1.

3 - Useless actions occasionally. Occasional uneasy or strained look on face. Outbursts in discussions occasionally. Doesn't work well or talk well under strain. Very quiet and shy.

4 - More frequent or violent manifestations listed in No. 3 above. Avoids all types of situations where poise is an asset. Is very introverted - withdrawn most of the time.

G. Attitude Towards Peers

0 - Has many friends and speaks a good word for almost all he knows. Has several close friends. He is accepted by many and is sympathetic and understanding of tragedy or misfortune of friends and peers.

1 - Seems to have many friends and to have been accepted by many others. Has at least one very close friend.

2 - Has several friends and speaks highly of them. Seems to avoid some and is not accepted by others.

3 - Seems to have some friends. Avoids or is not accepted by quite a few. Has some definite dissatisfactions with a few peers.

4 - Seems to have few friends. Is not accepted by many. Is quite dissatisfied with many of his peers.

H. Apparent Capacities

0 - Very intelligent.
1 - Above average.
2 - Average ability.
3 - Below average.
4 - Very low capacity.

I. Apparent Vocational Choice

0 - Strong choices. Fluent justification of choices.

1 - Choices evident. Justification evident. Objectives not clear but being contemplated.

2 - Several choices being considered. Comparisons being made. No objectives being planned.

3 - None definite or clear. Very few have been considered.

4 - No vocational choices have been considered.

J. Knowledge of Vocations

0 - Has investigated many vocations and has kept a file or record of interesting vocations which he might pursue.

1 - Has investigated many vocations but has not become extremely interested in the study. Is interested in reading about occupations.

2 - Seems to be interested in several occupations and has gained considerable information regarding them. Not interested in an extensive study.

3 - Has received limited information about occupations seems to have some interest in learning about them.

4 - Seems to have little or no information about vocations or occupations aside from those in his immediate neighborhood. Has very little information about the details of those.

Pickard, Robert F.
A Report, Vocational and Technical Education in Rhode Island, 1967-1973.

Rhode Island State Dept. of Education, Providence. Div. of Vocational Education
MF AVAILABLE IN VT-ERIC SET.
Pub Date - Nov67 114p.

*ANNUAL REPORTS; *VOCATIONAL EDUCATION; *TECHNICAL EDUCATION; *EDUCATIONAL OPPORTUNITIES; AREA VOCATIONAL SCHOOLS; *EDUCATIONAL NEEDS; POST SECONDARY EDUCATION; ADULT VOCATIONAL EDUCATION; STUDENT ENROLLMENT; CAREER CHOICE; EMPLOYMENT OPPORTUNITIES; EMPLOYMENT TRENDS; ECONOMIC FACTORS; EDUCATIONAL FINANCE
RHODE ISLAND

Selected information and recommendation concerning further implementation of Rhode Island's plan to strengthen and expand economic growth, low unemployment rates, and industry-wide employment gains indicated the necessity for a program of vocational and technical education geared to sustain and promote a healthy economy. A considerable disparity between student educational choices and available job opportunities was evident in that while 57 percent of high school students prepared for college entrance and presumably professional careers, only 10 percent of the State's work force was in the profession. Inplant training will provide preparation for workers to fill less than 10 percent of the approximately 85,000 job openings projected for 1971. Recommendations concerned (1) expanding vocational and technical education programs to serve 17 percent of the secondary school enrollment by 1970 and 20 percent by 1971, (2) expanding distributive and business cooperative programs, (3) increasing aid to local communities for operating area programs, including adult training, (4) developing facilities to serve an additional 625 post-secondary students in 1973 and 400 in 1975, and (5) Increasing the State vocational education staff as program activity increases. Also included are (1) data on 1966 enrollments by communities in area vocational school districts, area school programs and budgets, and finances, and (2) a bibliography. (HC)

January, 1968

TO: The Honorable John H. Chafee, Governor
The Honorable Members of the General Assembly

FROM: Robert F. Pickard, Chairman
State Board of Education

In compliance with the provisions of 16-45-3 of the General Laws, 1956 as amended, the State Board of Education respectfully submits its annual report on the status of vocational and technical education in Rhode Island. This year's report, in addition to summarizing activities to date, presents for your consideration a proposal for expanding and improving vocational and technical education opportunities through 1973. Specific recommendations pertaining to state-wide program development and a plan for financing this proposal are outlined.

The Board, in its desire to provide vocational and technical education for all in the State who need and desire it, urges favorable action by the Administration and the Legislature.

WILLIAM P. ROBINSON, JR.
COMMISSIONER

January, 1968

TO: State Board of Education

FROM: William P. Robinson, Jr., Commissioner of Education

The attached report is submitted in answer to your request for recommendations concerning vocational and technical education in Rhode Island through 1973. Major findings and recommendations are summarized in the front of the report and in Chapter VI.

This comprehensive study reviews the adequacy of existing and currently planned programs and facilities in relation to existing and anticipated need for occupational training. It proposes an expanded state-wide program of vocational and technical education designed to provide career guidance and training for a greater proportion of our State's youth and adults at both the secondary and post-secondary levels.

Recommendations are consistent with the Board's objectives of developing increasingly broadened educational opportunities for the citizens of Rhode Island and also include a reasonable approach to financing the improvements.

I am confident that implementation of the vocational and technical education program expansion as recommended in this report represents a forthright and logical approach to an educational issue.

# PREFACE

This report contains selected information relating to the development of Rhode Island vocational and technical education from 1967 to 1973. It was prepared in response to a request by the State Board of Education for facts and recommendations concerning further implementation of the State's plan to strengthen and expand occupational education and training throughout Rhode Island.

Separate chapters analyze the scope of our growing economy, increasing population and school enrollments, curriculum and career choices of high school students, projected job opportunities and present training programs. From this data have been drawn conclusions and recommendations for developing additional programs of vocational and technical education to satisfy individual as well as increasingly urgent economic needs.

The report was compiled by the State Staff of the Division of Vocational and Technical Education, assisted by many other persons and agencies. Special acknowledgement is made of the help and cooperation rendered by:

Walter M. Arnold, Ed.D. - Technical Education Consultant

Associate Commissioner
Vocational and Technical Education

## CONCLUSIONS AND RECOMMENDATIONS

1. Rhode Island Economy: The Rhode Island economy has enjoyed increased prosperity since 1963. Low unemployment rates and industry-wide employment gains have characterized the expansion. Since the general outlook is for a continuation of the State's economic advancement, Rhode Island's vocational and technical education program must be geared to sustain and promote a healthy economy.

2. Population and Enrollment: The overall population and secondary school enrollment in Rhode Island will continue to increase during the next five years in seven of the eight area vocational and technical school districts. Population growth figures by age group suggest various types of training needs. The State vocational and technical education program must adapt to the training and education needs of all citizens regardless of their personal or employment status.

3. High School Curriculum and Post-Secondary Career Choices: There is a great disparity between curriculum choices of high school students and employment level distribution in the labor force. Also, a serious disproportion exists between the number of students enrolled in a high school college preparatory curriculum and the number who actually enter and complete the four-year college program.

4. Employment Needs: Results of the recent skill survey conducted by the Department of Employment Security indicate that there will be a demand for 84,907 workers to meet expansion and replacement labor needs through 1971. In-plant training programs will provide only 5,600 workers leaving a training need in more than 79,000 positions.

At the completion of the present building program in 1969, vocational and technical education programs will be capable of enrolling 6,248 students and capable of graduating 2,493 trained students annually. When business education program graduates are added to this figure, a total of 6,275 trained students will be entering the labor force each year. Despite this substantial contribution to the skilled labor market, existing and presently planned vocational and technical programs will continue to fall far short of meeting the needs of students and industry.

5. Recommended Percentages of Secondary Students to be Served: It is recommended that Rhode Island's program of vocational and technical education be expanded to serve 17% of the secondary enrollment by 1970 and 20% by 1973. Such an objective is demanded by the State's projected economic and population growth, the diminishing need for unskilled workers and the personal needs of students. When compared with national data and studies from other States, the above percentages represent a realistic objective for Rhode Island.

6. Aid to Local Communities: Rhode Island has traditionally aided vocational and technical education in local communities through the reimbursement of operating expenses incurred by the vocational and technical program. As the number of programs increase and the demand on the property tax base also increases, it becomes more and more apparent that local communities will find it more and more difficult to financially sustain the quality programs envisioned for Rhode Island's area vocational and technical facilities. It is therefore recommended that aid to local communities for the operation of area vocational and technical programs be increased.

7. Distributive and Office Occupations Programs: Data from surveys and interviews with various Rhode Island business establishments indicate that one of the State's most rapidly growing occupational areas is in the field of product distribution. The surveys further suggest that we can anticipate a large increase in clerical and office related occupations.

It is therefore recommended that distributive and business cooperative education programs continue to be expanded in comprehensive high schools and that such expansion of local programs be encouraged by providing school districts with reimbursement from Federal and State funds.

8. Post-Secondary Programs: Data in Chapter III indicate that while 4,689 secondary students or 57.1% of the 1967 graduating class was enrolled in the college preparation curriculum, only 3,728 or 35.7% of these actually entered a four-year college. In addition to assisting the large percentage of students who prepare for a four-year college but do not attend, post-secondary vocational and technical education must be prepared to serve those students that will drop out of the four-year college (national figures show 50%) and those graduates of business, general and vocational and technical curriculums who desire a post-secondary education.

It is therefore recommended that facilities be developed to serve an additional 625 post-secondary students in 1973 and an additional 400 in 1975, and that the temporary campus in Providence be maintained until the proposed 625 student facility opens in 1973.

9. Adult Education Programs: Population data indicate that adults ages 23 to 44, the State's most productive working group, and the older working group, ages 45-64, will increase substantially. In view of rapidly changing technology, there will be a constant need for retraining and upgrading of the specialized skills and competencies of both of these groups if they are to remain competent and productive workers.

It is therefore recommended that aid to local communities for the operation of adult vocational and technical programs in area facilities be increased.

10. State Staff: During school year 1966-1967 a total of 2,007 students were enrolled in secondary and 220 in post-secondary vocational and technical education. With completion of the present building program and expansion of existing programs, a total of 5,684 students may be enrolled at the secondary level and 564 at the post-secondary level. Assuming expansion to the extent recommended, a total of 9,000 students at the secondary level, 1,589 at the post-secondary level, and 10,272 at the adult level can be accommodated.

It is therefore recommended that as program activity increases, the State vocational and technical staff be increased accordingly. Three professional staff members and two clerical assistants will be required by 1971.

# CHAPTER I

## ECONOMIC OVERVIEW AND EMPLOYMENT TRENDS

The design of a program of vocational and technical education for Rhode Island over the 1967-1973 period must consider the economic climate in which such a program will operate. A summary of the economic background of the State is presented as a basis for the recommendations to be made later in the report.

### Manufacturing

Rhode Island has depended heavily over the years on its manufacturing activities which in the 1940's provided 50% of the State's wage and salary jobs. Since that time, manufacturing has declined to approximately 40% due to the loss of much of the textile industry.

The number of workers employed in manufacturing industries declined from 154,700 in 1947 to 115,200 in 1964. However, Rhode Island's manufacturing employment has been increasing since that year. As of June, 1967, manufacturing employment totaled 126,000 (Table 1, Page 2 ). These gains have been the result of a national economic upswing and a concerted effort within the State to attract new industry and to hold existing plants. Considerable success has been achieved particularly in the strengthening of the metals and machine industry group. This industry showed an irregular pattern over the years, but since 1964 employment has been steadily rising with a new high of 41,600 persons employed as of December, 1966. A similar chronological pattern of decline and growth has been noted in the jewelry and silverware industry.

In the field of rubber and plastics, there has been some growth in the number of workers employed over the years. Between 1947-1967 there has been

TABLE 1

EMPLOYMENT IN MANUFACTURING AND NON-MANUFACTURING OTHER THAN AGRICULTURE IN RHODE ISLAND 1947-1967

| MAJOR INDUSTRY GROUP | 1947 | 1964 | 1967[1] |
|---|---|---|---|
| TOTAL EMPLOYMENT | 296,900 | 302,200 | 329,600 |
| MANUFACTURING | 154,700 | 115,200 | 126,700 |
| Textile | 66,700 | 23,300 | 23,100 |

| Jewelry/Silverware | 18,600 | 16,600 | 17,700 |
| Rubber/Miscellaneous Plastics | 7,400 | 8,500 | 9,000 |
| Apparel | 2,600 | 3,800 | 4,000 |
| NON-MANUFACTURING | 142,200 | 187,000 | 202,900 |
| Trade | 48,300 | 56,300 | 60,700 |
| Construction | 10,600 | 14,200 | 13,600 |
| Government | 28,900 | 42,800 | 49,600 |
| Service | 28,300 | 45,600 | 50,600 |
| TOTAL LABOR FORCE | 359,900 | 359,000 | 378,700 |
| UNEMPLOYMENT | 7.8% | 6.4% | 3.9% |

Source: Department of Employment Security

1 1967 figures are preliminary and represent an average for the first six months of the year.

an increase of 1,600 workers from 7,400 to 9,000. The apparel field, also, has shown considerable growth during the same period. In June, 1967 employment averaged 4,000 contrasted with 2,600 employed in 1947.

Non-Manufacturing

Employment in the non-manufacturing activities, chiefly in trade, government and service establishments, has advanced steadily with the number of jobs increasing from 142,000 in 1947 to 208,000 in June, 1967. In the non-manufacturing trade field there has been an increase of 12,000 jobs - - 4,000 of these occurring during the last three years.

In the construction industry a growth of 3,600 workers has been noted between 1947 and 1964 with a leveling off taking place recently. The service occupations have shown consistant growth since 1947 with an increase of 22,300 jobs.

Rhode Island is following the national trend with its farms increasing in size but declining in number. Approximately 1% of the State's work force is engaged in agricultural jobs. Economically, dairying continues to be the leading agricultural industry. Nursery and greenhouse businesses place second and poultry third. Other agriculture-related activities are continuing to develop in such fields as horticulture, landscaping, golf course groundskeeping, conservation and recreation.

In spite of the long-term swing towards non-manufacturing fields, the economic well-being of Rhode Island is still heavily dependent upon its manufacturing industry. It is this segment that largely determines the level of business and employment in the rest of the economy. The history and geography of Rhode Island commits the State's economy to a heavy dependence upon manufacturing payrolls. Evidence of this is found in the value of manufactured

products which was $1,830,000,000 in 1964. Other values of products and services of most recent record are shown in Table 2.

TABLE 2

No. of Establishments and Annual Value of Products and Services

| | No. of Establishments | Value of Physical Products | Value of Trade & Service |
|---|---|---|---|
| Manufacturing | 2,865 | $1,830,000,000 | |
| Wholesale | 1,436 | | $1,198,773,000 |
| Retail | 8,821 | | $1,125,878,000 |
| Service | 5,246 | | $ 158,292,000 |
| Tourist & Resort Business | | | $ 30,000,000 |
| Farms | 1,115 | $ 21,472,000 | |

Source: Rhode Island Development Council (latest figures available)
Research Division Revised
September, 1966

The net result of these improvements has been to change appreciably the composition of Rhode Island's manufacturing industries. Table 3, Page 5, illustrates these changes.

The result of this recovery in manufacturing, bolstered by the rapid expansion in non-manufacturing, has been to push up total non-agricultural employment in the State to new heights. This past year non-farm jobs averaged 328,800 up nearly 32,000 over the 1947 average of 296,900. As of June, 1967, the total employment in Rhode Island was 334,000. There is no available information to suggest any sustained interruption in recent tendencies toward further growth in the employment of the State.

TABLE 3

RHODE ISLAND LABOR FORCE - ESTIMATED EMPLOYMENT AND UNEMPLOYMENT 1963-1966
(IN THOUSANDS)

| Employment | Year | | | |
|---|---|---|---|---|
| | 1963 | 1964 | 1965 | 1966 |
| MANUFACTURING EMPLOYMENT | 115.5 | 115.2 | 121.3 | 126.9 |
| Textiles | 24.3 | 23.3 | 23.5 | 23.5 |
| Broadwoven | 5.7 | 5.5 | 5.7 | 5.6 |

| Instruments - Optical Goods | 4.1 | 4.2 | 4.2 | 4.5 |
| Miscellaneous (exc. jewelry) | 4.5 | 4.7 | 5.2 | 5.2 |
| All Other Manufacturing | 14.4 | 14.9 | 16.3 | 17.1 |
| NON-MANUFACTURING EMPLOYMENT | 182.0 | 187.0 | 195.5 | 201.9 |
| Trade | 55.8 | 56.3 | 58.3 | 60.3 |
| Construction | 12.5 | 14.2 | 14.3 | 14.4 |
| Government | 42.6 | 42.8 | 46.1 | 48.4 |
| Service & Other | 43.2 | 45.6 | 48.3 | 50.3 |
| Transportation & Public Utilities | 14.6 | 14.6 | 14.7 | 14.8 |
| Finance, Insurance & Real Estate | 13.3 | 13.5 | 13.8 | 13.7 |
| TOTAL WAGE & SALARIED EMPLOYMENT | 297.5 | 302.2 | 316.8 | 328.8 |
| Self-employed, Farm & Other | 33.8 | 33.8 | 33.8 | 34.3 |
| Unemployed | 25.3 | 22.8 | 18.0 | 14.0 |
| Labor Dispute | 0.3 | 0.2 | 0.3 | 0.1 |
| TOTAL LABOR FORCE | 356.9 | 359.0 | 368.9 | 377.2 |
| Ratio of Unemployed to Labor Force | 7.1 | 6.4 | 4.9 | 3.7 |

## The Labor Force

The State's labor force has continued to grow over recent years. From an average of 353,200 in the active labor force in 1960, the figure increased to an average of 377,200 in 1966. This rise of 24,000 (6.8%) in the past six years compares very favorably with the growth of 3.9% in the overall State population in the five year period from 1960-1965.

Along with progress in the employment economy, there has been a corresponding decline in the State's unemployed. The average of 14,000 jobless in 1966 was the lowest in over twenty years (3.7% of the labor force). Unemployment rate for the first six months in 1967 averaged 3.9%.

## Summary

The Rhode Island economy has been enjoying unparalleled vigor and prosperity in the past several years. Employment gains in the State have been practically industry-wide and almost all segments of the economy have shared in them to varying degrees.

From this favorable situation, the outlook is for a continuation of the State's economic advance to 1973 and probably beyond. The projections of future employment trends as indicated in Table 4 present bright prospects for the economic future of Rhode Island.

It is readily apparent that Rhode Island is in an excellent position to move forward with its program of vocational and technical education. From all available information regarding both the manufacturing and the non-manufacturing aspects of the State's economy, it would appear a necessity to further expand the vocational program to help meet the manpower requirements of industry as well as the training needs of youth and adults. As a result of effective planning and implementation, vocational and technical education will become an economic asset to Rhode Island as has been the case in several other states.

Rhode Island Special Commission to Study the Entire Field of Education April, 1967

1 The projections for industrial employment were synthesized from the projections presented in two studies: Arthur D. Little, Inc. Projective Economic Studies of New England, (Cambridge, Mass., mimeographed, 1964-65). (Department of Economics), Brown University. Foundation Study, (Providence, R. I.: mimeographed, 1964)

# CHAPTER II

## POPULATION CHARACTERISTICS AND SCHOOL ENROLLMENTS

### Population Characteristics

As will be shown in this section, reference to the changing population characteristics of Rhode Island is necessary if vocational and technical programs are to be developed to meet the needs of all citizens who may profit from training.

During the last decade the population of Rhode Island has been on the increase creating greater need for expanded public facilities of all types including those required for occupational education. The State's population grew from 791,896 in 1950 to 859,488 in 1960, an increase of 8.54%. Growth continued from 1961 to 1965 with a five year increase of 33,312 for a total population of 892,700. This represents a 3.89% increase over the 1960 population. It is estimated that the population will continue to increase substantially during the next eight years and that Rhode Island will have a population in excess of 970,000 by 1973. Table 5 illustrates this rise.

TABLE 5

Population for Rhode Island 1880-1973

| | |
|---|---|
| 1880 | 276,531 |
| 1890 | 345,506 |
| 1900 | 428,556 |
| 1910 | 542,610 |
| 1920 | 604,397 |
| 1930 | 687,497 |
| 1940 | 713,346 |
| 1950 | 791,896 |
| 1960 | 859,488 |
| 1965 | 892,709 |
| 1970 | 942,000 |
| 1973[1] | 953,800 |

[1]Figures for 1973 interpolated from 1975 projections

Source: Population Projections for the State of Rhode Island and its Municipalities, Rhode Island Statewide Comprehensive Transportation and Land Use Planning Program, December, 1966

Together with increasing population, migration from the urban areas to the suburbs is expected to continue during the next fifteen years. While Providence may anticipate losing some of its residents, the suburban cities and towns such as Cranston, Warwick, East Greenwich and Coventry are expected to realize a large percentage of increase in their present populations.

In-state shifting of population must be considered in determining which geographical areas of the State should receive priority in future vocational and technical facilities and/or program development (See Table 6, Page 10).

Age and sex distribution of the present and projected population are additional factors to be considered, since such information aids planners in determining not only the level at which certain programs may be more effectively offered but also in providing a guide to establishment of suitable proportions between programs for males and for females. Table 7 shows projected population increases by age, group, and sex.

TABLE 7

Rhode Island Population Projections by Age and Sex Groups - 1965-1973

| Year | Age Group | Male | Female | Total | Percent of Total Pop. |
|---|---|---|---|---|---|
| 1965 | 15-18 | 31,880 | 30,676 | 62,556 | 7.01 |

[1]Totals may not add due to independent rounding

[2]Figures for 1973 interpolated from 1975 projections

The secondary school group, ages 15 to 18 inclusive, will grow from 62,556 in 1965 to 73,610 in 1973; an increase of 11,054 or 17.67% in eight years. Vocational and technical facilities and programs on the secondary level must be geared to meet the needs of this group.

The post-secondary group, ages 19-22 inclusive, will grow from 54,270 to 74,248 in 1973, an increase of 19,978 or 36.81% in eight years. Expanded facilities will also be required to serve this large group.

Growth is also projected for the most productive working group, ages 23 to 44; from 234,425 in 1965 to 253,140 in 1973, an increase of 18,705 or 7.98% in eight years. Increases are similarly expected in the older working group, ages 45 to 64; from 192,303 in 1965 to 206,247 in 1973, an increase of 13,944 or 7.25%.

In tomorrow's rapidly changing technological society each of these groups will be in constant need of retraining and/or upgrading in their specialized skills if they are to remain competent and productive workers.

School Enrollments

In projecting the extent of occupational program expansion required in Rhode Island during the coming years, it is essential to not only review the general population characteristics but, also, to analyze the more particular data relating to high school enrollment.

The Rhode Island Commission to Study the Entire Field of Education has recently completed a study which shows the actual and estimated number of students enrolled in all Rhode Island schools through the year 1990. As indicated in Table 8, Page 13 an increase of 7,213 grade 10-12 students is projected for the period 1966-1973. Vocational and technical facilities must be constructed and new programs developed to meet this emerging need.

TABLE 8

Actual and Estimated[1] Number of Persons Enrolled in Rhode Island Schools - Grades 10-12

| | |
|---|---|
| 1966 | 37,787 |
| 1967 | 38,100 |
| 1968 | 39,900 |
| 1969 | 41,500 |
| 1970 | 42,400 |
| 1971 | 43,500 |
| 1972 | 44,400 |
| 1973 | 45,000 |

[1]The base data and projections are for students enrolled at a specific grade level; students in special, ungraded or post-graduate classes are not included.

Source: 1966 figures (actual) - Rhode Island Department of Education 1967-1973 (estimated) - Rhode Island Commission to Study the Entire Field of Education

Actual enrollment by area vocational school district for 1966 in grades 10-12 is shown in Table 9, Page 14, (Appendix A contains a breakdown of enrollments for each community).

It should be pointed out that while area school enrollment is a primary factor in determining the scope of program offerings suitable for a given region, several other critical factors must be considered. These include the extent of present local commitments to vocational education, the percentage of the State's industry which is located in the regional school district, the degree of individual community interest in supporting programs of vocational and technical education, and the adaptability of local educational facilities to comprehensive program development.

Actual geographic location for facility development as recommended in this report is also heavily dependent on the State's recent proposal concerning Rhode Island school district reorganization.

Summary

Population statistics presented in this chapter emphasize the need for additional vocational and technical facilities. Such facilities must meet

TABLE 9

ACTUAL 1966 ENROLLMENTS AND PERCENTAGES OF THE TOTAL STATE ENROLLMENT
BY AREA VOCATIONAL SCHOOL DISTRICTS - GRADES 10-12

| Area School District | 1966 Enrollment | Percentages of Total State Enrollment |
|---|---|---|
| Blackstone Valley | 8,048 | 21.3% |
| Chariho | 2,002 | 5.3% |
| Coventry | 2,298 | 6.1% |
| East Providence | 4,208 | 11.1% |
| Newport | 3,233 | 8.6% |
| Ponaganset | 1,133 | 3.0% |
| Providence | 8,538 | 22.5% |
| Warwick | 8,327 | 22.1% |
| | 37,787 | 100.0% |

Source: Rhode Island Department of Education, November, 1967

the needs of an enlarged population, must be adequate to train both secondary and post-secondary students, and must prepare our working citizens for adaptation to the complex technical positions which are rapidly developing in the industrial and business community.

Assuming an increased future school population and a greater precentage of secondary and post-secondary students enrolled in vocational and technical education programs, present planning must anticipate an increasing need for training facilities. Vocational and technical programs must be capable of meeting the future needs of all citizens regardless of their age or type of training required. Data in this chapter will be used later in the report as a basis for estimating the number of training stations which will be required.

# CHAPTER III

## EDUCATION CHOICES AND EMPLOYMENT OPPORTUNITIES

It is essential that a balance be achieved between the type of program followed by secondary school students and the employment opportunities available in the State if vocational and technical education is to help individuals and support the economy of Rhode Island.

This chapter discusses the paradox of large numbers of high school students following educational programs which are not in line with the State's employment structure and the following related issues:

1. students continuing their education beyond the secondary level
2. students graduating from vocational and technical programs
3. students who fail to graduate from high school

### Program Choices of High School Students

Information concerning 75.4% of the State's 1967 public school seniors was obtained from all geographical areas of the State to determine student distribution according to program. The results are as follows:

| Program | Percent | Number |
|---|---|---|
| College Preparatory | 50.7 | 3,457 |
| Office Occupations | 28.8 | 1,963 |
| Vocational | 5.3 | 361 |
| General | 14.9 | 1,012 |
| Unaccounted | 0.3 | 23 |
| Total | 100.0 | 6,816 |

Since the vast majority of parochial school students are enrolled in college preparatory programs (over 80%), no separate tabulation is presented in this report. However, combined public and parochial school data indicate that 4,689 students or 57.1% of the enrollment prepared for college.

Chart I, Page 18, contrasts high school enrollment by program with employment by occupational area. The figures illustrate broad discrepancies between the programs that youngsters enroll in and actual employment opportunities in Rhode Island.

Table 10 below indicates that professional occupations alone, which currently make up 10.1% of the employment market require a four-year college degree; whereas, 50.7% of the State's public high school students are enrolled in college preparatory programs.

TABLE 10

MEDIAN YEARS OF SCHOOL COMPLETED BY THE
CIVILIAN LABOR FORCE 18 YEARS AND OVER

March, 1966

| Occupational Category | Years of School |
|---|---|
| Professional | 16.3 |
| Managerial (non form) | 12.6 |
| Clerical | 12.5 |
| Sales | 12.5 |
| Craftsmen and Foremen | 11.9 |
| Operatives | 10.7 |
| Service, Including Private Household | 10.9 |
| Farmers, Farm Managers, Laborers, Foremen | 8.8 |
| Laborers, except Farm and Mine | 9.5 |

Source: Manpower Report of the President, April, 1967, Page 240

## CHART I

## EMPLOYMENT BY OCCUPATIONAL AREAS

Source: U. S. Bureau of the Census 1960

## HIGH SCHOOL ENROLLMENT BY PROGRAMS

Source: R. I. Dept. of Education

While many of the positions requiring some post-secondary preparation (29.7%) will presumably be filled by college preparatory program graduates, the remaining 60.2% of Rhode Island employment is found in areas which currently require no post-secondary education. It would appear that since all employers are continuing to demand a higher and higher degree of technical competency of their workers, a larger proportion of Rhode Island's high school students should be gaining preparation for such occupations while they are still in school.

Career Choices of High School Seniors

Post high school career choice data were obtained for June, 1967 Rhode Island public and parochial high school graduates. All public high schools and twelve parochial high schools representing 76.4% of the State's parochial high school graduates were used as the sample for Table 11.

TABLE 11

Post High School Educational Choices of Public and Parochial Rhode Island High School Graduates-1967

| School | Graduates | Entered 4 Yr. College | Entered Other Post-Secondary School | Combined College & Other Post-Secondary |
|---|---|---|---|---|
| Public | 9,044 | 2,970 (32.8%) | 2,207 (24.4%) | 5,177 (57.2%) |
| Parochial | 1,385 | 758 (54.7%) | 315 (22.7%) | 1,073 (77.4%) |
| TOTAL | 10,429 | 3,728 (35.7%) | 2,522 (24.2%) | 6,250 (59.9%) |

Source: Rhode Island Department of Education

Table 11 shows that 35.7% of the State's current graduates entered four-year colleges and 24.2% enrolled in other types of post-secondary institutions such as trade schools, technical schools, or junior colleges. Thus, a total of 59.9% of the students continued their education beyond high school.

Information provided by the United States Office of Education indicates that approximately one-half of those students entering a four-year college do not complete the degree requirements. These statistics offer further evidence of the lack of realism currently underlying program choice by high school students.

Graduate Follow-Up of 1966 Vocational-Technical Students

Table 12, Page 21, provides information relating to career pursuits of students graduating from present vocational and technical programs in Rhode Island.

Of the 600 graduates in June, 1966, 52% or 313 were available for employment, 27% entered the armed forces and 18% continued full-time schooling at the post-secondary level. Eighty-one per cent of those available for placement were employed in an occupation related to their school training, and 14% were employed in non-training-related occupations. At the time of the follow-up, 4% of the graduates were employed part-time and only 1% were unemployed.

The placement percentage of Rhode Island's vocational and technical program graduates closely parallels the national average. Fifty-two per cent of the 1966 Rhode Island vocational and technical graduates were available for placement, and 58% were available for placement nationally. In Rhode Island 81% of those available for employment were placed in training related occupations, whereas nationally the figure was 80%.

School Dropouts and Retention

In estimating retention rates from fifth grade through college graduation for the years 1957 to 1969, the 1966 Digest of Educational Statistics shows that of every 100 pupils in the fifth grade, 94 entered the ninth grade,

TABLE 12

FOLLOW-UP OF THE JUNE, 1966 GRADUATES
VOCATIONAL-TECHNICAL EDUCATION

| Graduates | Agriculture | Distribution | Health | Home Economics Wage Earning | Technical | Trade & Industry | Total No. | Total Percent |
|---|---|---|---|---|---|---|---|---|
| Completed Program | 138 | 47 | 104 | 5 | 50 | 256 | 600 | 100% |
| Not Available for Placement | 78 | 23 | 14 | - | 27 | 145 | 287 | 48% |
| Status Unknown | - | 2 | 4 | - | - | 3 | 9 | 2% |
| Entered Armed Forces | 44 | 9 | 2 | - | 12 | 96 | 163 | 27% |
| Continued Full-Time School | 30 | 11 | 6 | - | 15 | 45 | 107 | 18% |
| Other Reasons not in Labor Force | 4 | 1 | 2 | - | - | 1 | 8 | 1% |

Source: Rhode Island Department of Education, December, 1966

81 entered the eleventh grade, 71 graduated from high school, 38 entered college and only 19 are likely to earn a four-year college degree in 1969.

Such data clearly indicate that something more must be done for the 29 out of every 100 youngsters who fail to graduate from high school, and also for the 52 out of every 100 who will graduate from high school but not from a four-year college. One means of preparing these students for more productive lives is to provide more secondary and post-secondary vocational and technical education opportunities.

Among the several major reasons given as to why Rhode Island students drop out of school are need for earnings, lack of an appropriate curriculum and academic difficulty. The most recent statistics compiled by the Rhode Island Department of Education reveal that 60% of the dropouts left school because of a lack of interest in their programs or to seek employment. This percentage involves almost 2,000 students and it can be assumed that many of these left school because the limited program offerings in their schools were not suited to their needs.

One approach to the solution of this problem is an effective program of vocational guidance which will identify the potential dropout while he is still in school and advise him of the benefits which will be derived from an occupational curriculum.

Vocational education provides these benefits in at least three ways:

1. It helps keep the potential dropout in school by offering a program more meaningful to him.
2. It permits some students to enroll in cooperative type programs in which they can "earn while they learn."
3. It helps prepare students more adequately for initial employment if dropping out is inevitable.

Summary

There is considerable disparity between the educational choices of students and available job opportunities in the Rhode Island economy. Whereas 57.1% of high school students prepare for college entrance and presumably professional careers, only 10.1% of the Rhode Island work force is in the professions. To compound this problem, only 35.7% of the students in college preparatory courses actually enroll in a four-year college and only 50% of these finally acquire the baccalaureate degree. Added to this lack of realism is the tragic record of students leaving high school before graduation.

The major conclusions which can be drawn from the foregoing data are:

1. While it is not intended that vocational and technical education should attract students away from college preparation it is recognized that for some college preparatory students enrollment in technical courses will serve as an integrating factor making their academic subjects more meaningful.
2. Potential school dropouts must be identified as early as possible and appropriate occupational programs established for them.
3. The capacity and range of vocational and technical education offerings must be expanded at both the secondary and post-secondary levels so as to prepare for productive employment:
    a. students in high school
    b. high school graduates
    c. out of school youth
    d. employed or unemployed adults

# CHAPTER IV

## JOB OPPORTUNITIES AND TRAINING NEEDS

As has been stated in preceding chapters, any attempt to estimate the extent to which education should provide youth with occupational training during the years ahead must be based on a number of factors. Especially significant are the number and type of job opportunities which are expected to occur in Rhode Island during the next five years, recommendations of employers and new and emerging occupations.

### The Rhode Island Skill Survey - 1968 and 1971

A skill survey conducted this past year by the Rhode Island Department of Employment Security represents the most comprehensive source of statewide data concerning employment and expected skill shortages and is a valuable indicator of the direction toward which occupational training programs should move. This study covers the period from 1968 through 1971 and is based on manpower need estimates secured from over 1300 Rhode Island employers. Supplementary assistance in the conduct of the survey was provided by many civic, commercial, trade, industrial and labor organizations to produce a picture of the expected labor supply and demand developing in Rhode Island in 1968 and 1971.

General findings of the study reflect a strong confidence for a continuance of the economic prosperity which began gathering momentum in Rhode Island during 1963. Employers predict an overall increase in the number of persons employed by the surveyed industries at 46,000 jobs exclusive of replacement requirements by 1971 - - a prediction 3.4 times higher than that forecast in a 1960 Department of Employment Security study.

Expansion and replacement needs of employers will require filling 84,907 jobs over the five-year period. Since in-plant instructional programs are estimated by the study to satisfy only 7% of these requirements, it is clear that an extensive program of vocational and technical education must be implemented if the State's labor market is to keep pace with the increasing demand for skilled workers.

Table 13, Page 26, shows the estimated number of workers which will be required by Rhode Island industry during the years immediately ahead for jobs created by replacement and expansion. Especially relevant is the column at the far right which shows thousands of job opportunities occurring - - jobs for which Rhode Island workers will not be prepared without pre-employment training.

The table also shows clearly that the training plans of employers will fall far short of producing the number of workers needed by 1971. A total of 84,907 jobs will open. Only 5,602 of these will be filled by in-plant training. Thus, 79,305 jobs must be filled by persons trained through other sources.

While Manpower Development Training Programs and Area Redevelopment Act Courses have made some impact by producing 2,042 trained workers in certain hard-to-fill occupations, such as machinist, office workers, automobile mechanics and draftsmen, during the past five and one-half years, emphasis of these programs has been shifted recently by the sponsoring federal agency to programs for the disadvantaged.

With the exception of office education, the number of students completing occupational training programs in privately operated schools throughout Rhode Island is insignificant; nor is expansion anticipated in this area of potential training.

TABLE 13

ANTICIPATED WORKER DEMAND IN SELECTED OCCUPATIONS - 1971

| Occupation | Survey Employment Oct., 1966 | Expansion & Replacement Needs 1971 | In-Plant Training Output 1971 | Unmet Worker Demand 1971 |
|---|---|---|---|---|
| **Professional, Technical & Managerial Occupations** | | | | |
| Computer Programmer | 346 | 355 | 100 | 255 |

| Truck Driver, Heavy | 1,841 | 1,083 | - | 1,083 |

Source: Rhode Island Department of Employment Security

Existing vocational and technical programs cannot satisfy the requirements of industry and commerce as outlined above. Even with the addition of eight new secondary facilities and the expanded post-secondary program, the number of graduates will be insufficient to meet the growing need. Ways and means must be found to substantially increase the number of skilled persons in our economy.

Interview Survey

A series of interviews with employers was conducted by the Vocational and Technical Division staff to determine the views of employers concerning the role of vocational and technical education in Rhode Island. A representative sampling of employers was chosen to obtain a wide range of products and/or services, geographic locations, and numbers of persons employed. Considerable information was derived from the reactions and advice offered by the employers.

Interviewers presented a brief report of the statewide program of vocational and technical education to the employers, and then questioned them concerning the following:

1. What is the reaction of the employer to the Rhode Island plan for developing vocational and technical education?
2. What training plans and/or problems does the employer have?
3. What is the employers attitude toward training, in-plant and in-school?
4. Does the employer have problems hiring trained help?
5. Does the employer have a need for supplementary or upgrading training?
6. Does the employer have new types of equipment or does he have plans for the purchase of such in his plant?

Major findings were:

1. Employers are interested and concerned about the Rhode Island program of vocational and technical education.
2. Employers made it clear that they are willing to cooperate and assist in further development and improvement of the State's program.
3. There is a persistent shortage of skilled workers in many occupations throughout the State. Recruitment of young trained workers is extremely difficult.
4. Employers generally agree on the merits of a combination of in-school and in-plant training including cooperative education.
5. Quality basic or general education for vocational and technical students is needed.
6. Vocational guidance and counseling services should be offered to younger students in order to familiarize them with the world of work.
7. There is a need for more supplementary and upgrading type of extension courses to increase the skills and technical knowledge of employed workers.
8. There is a continuous demand for higher technical skills because of new sophisticated equipment and higher quality standards.

Nationally Emerging Occupations

There are many evidences that continued scientific break-through and rapid technological development will not only bring sharp changes in existing job requirements but also will create many new kinds of work.

The computer is entering every aspect of American life including schools, medicine and business. Nuclear facilities will be expanded greatly to meet

the surging power demand of the space age. Approximately three times the energy presently used will be required by the year 2,000. Airplanes capable of traveling 4,000 miles per hour will require new materials. Anti-pollution and safety measures will force major changes in design and production of automobiles. Electronic aids and computers will help to make education a life-long process. Medical gains, particularly new drugs, will reduce heart and cancer deaths as well as birth defects. Capability for both nuclear war and smaller size conflicts will require orbiting weapons and greater mobility of ground forces.

Requirement for Technicians

All of these predicted developments indicate that most new jobs will require that workers attain a more technological background. The requirement for technically skilled workers in the United States will reach nearly one and a half million by 1975 representing an increase of over 77% from the 1963 employment level.

Kinds of Technicians Needed

The following are examples of new kinds of technicians needed to meet the challenge of technological development but for which training programs are not well developed:

| New Types of Technicians | Present Demand |
|---|---|
| Bio-medical Hospital | 50,000 |
| Electromechanical | 100,000 |
| Electronic Computer Service | 20,000 |
| Communications and Telementry | 10,000 |
| Computerized Drafting | 5,000 |

| | |
|---|---|
| Numerically Controlled Machine Tool | 10,000 |
| Chemical Manufacturing Process Control | 5,000 |
| Agricultural Production and Service | 75,000 |
| Water Pollution Control Technicians | 10,000 |
| Total | 285,000 |

Various descriptive names are given to the different kinds of technicians but almost all of them may be placed within the following general classification:

Physical Science and Related Engineering Technologies

Aeronautical and Aerospace
Architectural and Building Construction
Civil (Highway and Structural)
Chemical
Electrical and/or Electronic
Electro-mechanical
Instrumentation
Mechanical, Design or Production (Includes Heating, Air-Conditioning and Refrigeration, Plastics, and Welding)
Metallurgical (Including Ceramics)
Mining (Including Earth Sciences)
Nuclear
Oceanographic (Physical)
Printing (Including Photography - Graphic Arts)
Radiological (Physical)

Biological Science Technologies

Health and Related Technologies

Dental Hygienist
Dental Laboratory
Inhallation Therapist
Occupational and Rehabilitation Therapist
Medical Laboratory
Nursing (2-year Diploma or Certificate)
Radiological (Including X-ray)

Agricultural and Related Technologies

Livestock Production (Cattle, Sheep, Swine, Horses)
Dairy Production
Poultry
Other Specialized Animal Science
Diversified Farm Production

Farm Crop Production
(Field Crops, Forage, Orchards and Vineyards, Intensive Vegetable Culture)
Ornamental Horticulture
(Nursery, Floriculture, Turf Management, Arboraculture, Landscape Development)
Other Specialized Plant Science
Grain, Feed, Seed and Farm Supply Service
Forestry
Conservation, Recreation, and Wildlife
Soil Science, Reclamation, and Conservation

Combined Physical and Biological Science Technologies

Agricultural Equipment
(Farm Machines and Mechanization Systems)
Dairy Products Processing
Food Processing
(Canning, Drying, Freezing, Freeze Drying, etc.)
Bio-medical (Hospital and Research) Mechanisms
Oceanographic
(Fishing, Mariculture, and Other Biological)
Water and Environmental Control (Water and Waste Water; Solid Waste, Atmosphere)
Scientific Data Processing

The foregoing is only a partial list. It could well include Oceanographic, Radiological, Nuclear, Electro Optical, Urban Planning, Police Science, Fire Protection, and Air Pollution Technicians - all needed, with relatively few or virtually none being trained.

Special Needs

In planning future vocational and technical education programs, it becomes increasingly important to consider the special training needs of many of Rhode Island's youth and adults. One of the major provisions of the Vocational Education Act of 1963 pertains to the responsibility of the State and local communities to provide vocational education for the disadvantaged and handicapped. These include people who have academic, socio-economic, or other handicaps that prevent them from succeeding in the regular vocational education programs. While the Manpower Development and Training Program, the Vocational Rehabilitation Program, and the Adult Basic Education Program should continue to provide training for some of

those with special training needs, vocational education should be prepared to meet their occupational training requirements.

Summary

Employment projections made by the Department of Employment Security indicates that Rhode Island can anticipate approximately 85,000 job openings by 1971. Since in-plant training will provide preparation for workers to fill less than 10% of the openings, it can readily be seen that a means of increasing occupational training must be found. The results of the employer interview survey conducted by the Vocational Division staff substantiate the fact that programs and facilities must be expanded if job needs are to be met.

A projection of emerging occupations indicates that training for the future will also involve more technological skills. As new occupations emerge, Rhode Island's program of vocational and technical education must be capable of providing the necessary training.

# CHAPTER V

## THE RHODE ISLAND PROGRAM OF VOCATIONAL AND TECHNICAL EDUCATION

### Philosophy and Rationale of the Rhode Island Program for Vocational and Technical Education

The Administrative Plan for Vocational and Technical Education in Rhode Island as adopted by the State Board of Education points the way to an overall philosophy of an effective program. It is the belief of the Board that schools should provide the kind of education which will produce students able to make a meaningful contribution to society, to sustain and improve both the State's and the nation's economy, to adapt to change as change is demanded of them, to support themselves and their families, to develop their own greatest potential, and to lead full and rewarding personal lives.

In order to appreciate the importance of the relationships of economic factors and trends to occupational training needs, it is important to define some of the overall purposes and aims of vocational education. Very basically the controlling purpose of vocational education is to fit persons for gainful employment. The vocational education program, however, does not take the place of general academic education; it supplements and enhances it to assist those students who want preparation for a chosen occupation. Vocational education is a part of a well-rounded program of studies aimed at developing competent workers and recognizing that the American worker should also be comptent economically, socially, emotionally, physically, intellectually, and in a civic sense.

Vocational education helps to give definite purpose and meaning to education by relating training to specific occupational goals.

It is more inclusive than training for job skills; it develops abilities understandings, attitudes, work habits, and appreciations which contribute to a satisfying and productive life.

Vocational education for adults plays an essential role in maintaining efficiency in production, distribution and consumption, and, as a consequence, a high standard of living. Adult workers in any field through training in skills and knowledge related to their occupation can adapt themselves to technological advances and other developments in their field of endeavor, become more productive, prepare themselves for advancement, and increase their earning capacity.

The Vocational Education Act of 1963 was passed by the 88th Congress for the purpose of maintaining, extending, and improving existing programs of vocational education, and developing new programs, so that persons of all ages in all communities will have ready access to vocational training or retraining. The 1963 Act, which provides about $1,000,000 annually for program development in the State of Rhode Island, states that:

1. Programs need to be geared to immediate and projected labor market needs - local, State, regional and national.

2. Programs are to be developed for all non-professional occupations - low skill to high skill.

3. Programs are to be developed for persons of all ability levels - appropriate to their capacities, interests, and needs.

4. Programs can and do operate in all kinds of institutions - public and private.

The Vocational Education Act of 1963 lists the following groups of persons to be served:

1. Vocational education for persons attending high school

2. Vocational education for persons who have completed or left high school and who are available for full-time study in preparation for entering the labor market

3. Vocational education for persons who have already entered the labor market and who need training or retraining to achieve stability or advancement in employment

4. Specialized vocational education for persons who have academic, socio-economic, or other handicaps that prevent them from succeeding in the regular vocational education program

## The Design of the Rhode Island Program for Vocational and Technical Education

A central concept underlying the design of the Rhode Island program is that appropriate vocational and technical educational opportunities of high quality should be readily accessible to both youth and adults in all communities of the State who want and need training for a chosen occupation. Extensive vocational and technical program development is under way in Rhode Island at both the secondary and post-secondary levels.

### Secondary Level

Recognizing that all schools cannot justify initiation of a full range of occupational programs in terms of either numbers of students to be served or cost, the Vocational Education Act of 1963 makes provision for area vocational schools which serve a number of communities. In order to make diversified occupational offerings of high quality available to all secondary school students in Rhode Island, the State Board of Education has designated certain comprehensive or vocational and technical high schools as area schools to serve the geographic areas in which they are located. A total of eight area vocational and technical schools are planned; seven of these schools are additions to comprehensive high schools and the eight is a self-contained vocational and technical high school. It is the intention of the State Board of Education that maximum use of the area school facilities be made by the communities for the educational needs of adults as well as youth.

Through agreement between the State Board of Education and the school committee of the community in which the comprehensive area high school is located, the school committee will be responsible for the operation of the program and the State Board will provide certain construction, renovation, equipment and administrative and guidance staffing. The self-contained area vocational and technical school in the Blackstone Valley will be state-operated.

Tuition is to be charged by the area school to the sending school in an amount not to exceed the per capita cost of operation. Transportation of pupils to the area schools is the responsibility of the school committee sending the pupil to the area school. Map 1 indicates the proposed vocational and technical facilities and the communities they will serve.

Post-Secondary Level

The Board of Trustees of State Colleges and the Board of Education are committed to the principle of jointly planned, constructed and operated facilities for the junior college and post-secondary vocational and technical programs. Such cooperative effort, it is felt, is essential to their task of providing the highest quality comprehensive education at the lowest possible cost. In the opinion of both Boards joint operation of the facilities would ensure the broadest and most effective educational programs of the youth and adults of Rhode Island, would provide maximum service to business and industrial establishments, and would be more economical than separate development of facilities, since the partnership would achieve maximum use of available funds and resources and would avoid duplication of essential facilities. Tentative location of the three junior college vocational and technical facilities is presented on Map 1.

# LOCATIONS OF PROPOSED SECONDARY AND POST-SECONDARY VOCATIONAL-TECHNICAL FACILITIES

Present Enrollment in Vocational and Technical Education Programs

During the 1966-1967 school year, 2,007 Rhode Island students were enrolled in secondary vocational education and 220 students were enrolled full-time at the post-secondary level. Secondary vocational and technical enrollment figures do not include office education which is generally a part of all high school curriculums; nor is non-occupational home economics education enrollment included. Table 14 indicates student enrollment by occupational area.

TABLE 14

Student Enrollment by Occupation Area
1966-1967

| Occupational Area | Secondary 10-12 | Post Secondary |
|---|---|---|
| Agriculture | 435 | 0 |
| Distributive Education | 60 | 0 |
| Health Occupations | 19 | 114 |
| Home Economics (Wage Earning Only) | 54 | 0 |
| Technical | 65 | 96 |
| Trade and Industry | 1,374 | 15 |
| TOTALS | 2,007 | 220 |

Source: Rhode Island Department of Education, Vocational Division Annual Report - 1967

A survey recently completed by the Board of Public Education in Pittsburgh, which city is in many ways statistically comparable to Rhode Island, indicates that at least 60% of the current and future high school population should be given some occupational, vocational, or technical training, other than the four-year college preparatory program. In another study conducted in Howard County Maryland, also similar to Rhode Island, it was recommended that 25% of the total school population in grades 10-12 should be enrolled in vocational training

other than business education. Nationally, the United States Office of Education is projecting vocational and technical enrollments at 30% to 50% by 1975.

It is also significant to note that a National Committee Paper by the National Association of Secondary School Principals, Educating for Work, recommends that vocational and technical education should be serving between 40% and 50% of the nation's secondary school students.

When such data are compared with Rhode Island's present secondary vocational and technical education enrollment of 2,007 or 5.3% of the present total enrollment, it can be readily seen that the Rhode Island Program must grow considerably if it is to meet the needs of the State's youth and industry.

The projected enrollment of 5,684 or 13.7% in 1969, which includes agriculture, distributive education, home economics wage earning and cooperative business education programs in comprehensive high schools, is listed below. An attempt to serve more than 5,684 at the secondary level in vocational and technical education in 1969 will require additional construction and financing as outlined in Chapter VI.

Projected Enrollment by Districts (1969)

| Area School District | Capacity 1969 |
|---|---|
| Blackstone Valley | 1,152 |
| Chariho | 405 |
| Coventry | 438 |
| East Providence | 482 |
| Newport | 592 |
| Ponaganset | 315 |
| Providence | 1,397 |
| Warwick | 903 |
| TOTAL | 5,684 |

Table 15, Page 42, indicates projected fiscal 1969 capacity by occupational area in both the existing and committed facilities (Appendix B contains detailed

information regarding the new facilities). All new facilities are being planned and constructed to provide maximum flexibility in order to accommodate any change in occupational demands. Table 16, Page 43, shows the projected number of graduates of secondary vocational and technical programs through 1973.

Committed Programs - Post-Secondary Level

The temporary laboratory and classroom space located at Capitol Industrial Center in Providence will serve a total of 352 vocational and technical students each year through fiscal year 1970. The Knight Campus, scheduled to open in Warwick in September, 1971, will accommodate 450 students per year. The increase of 98 students served at the Warwick facility is made possible through the use of additional classroom space not available at the temporary facility. The 450 vocational and technical students to be served at the Knight Campus represents 15% of the entire institution's enrollment of 3,000 students.

TABLE 15

PROJECTED STUDENT CAPACITY BY OCCUPATIONAL AREA IN SECONDARY FACILITIES - 1969

| Occupational Area | Present Facilities | Committed Facilities | Total |
|---|---|---|---|

Facility Funding

Table 17, Page 45, shows total funds available for construction and expenditures through 1969. Of the $15,439,315 available for the building program, the State provided $12,000,000 and the Federal government provided $3,439,315. Table 18, Page 46, indicates the distribution of federal funds by fiscal year and construction project.

Summary

Rhode Island's program of vocational and technical education served 2,007 secondary students and 220 post-secondary students during the 1966-1967 school year. When the presently planned building program is completed, a total of 5,684 secondary students and 564 post-secondary students will be served by vocational and technical education. This expansion will require expenditure of all currently available Federal and State funds ($15,439,315 through June 30, 1969).

As indicated above, Rhode Island's vocational and technical education facilities served 2,007 students or 5.3% of the grade 10-12 enrollment during the school year 1966-1967. Upon completion of the present building program, Rhode Island will have the capability of serving 5,684 students or 13.7% in secondary vocational and technical education. While this increase appears substantial, it should be noted that a decreasing percentage of students will be served as the grade 10-12 population increases.

When one compares the projected number of graduates from the existing and presently planned facilities with the projected number of skilled workers needed as shown in Chapter IV, it can be readily seen that vocational and technical education needs further expansion. Chapter VI outlines a recommended expansion program and shows projected costs for such expansion.

# CHAPTER VI

## CONCLUSIONS, RECOMMENDATIONS, FINANCING

### Conclusions and Recommendations

1. Rhode Island Economy: The Rhode Island economy has enjoyed increased prosperity since 1963. Low unemployment rates and industry-wide employment gains have characterized the expansion. Since the general outlook is for a continuation of the State's economic advancement, Rhode Island's vocational and technical education program must be geared to sustain and promote a healthy economy.

2. Population and Enrollment: The overall population and secondary school enrollment in Rhode Island will continue to increase during the next five years in seven of the eight area vocational and technical school districts. Population growth figures by age group suggest various types of training needs. The State vocational and technical education program must adapt to the training and education needs of all citizens regardless of their personal or employment status.

3. High School Curriculum and Post-Secondary Career Choices: There is a great disparity between curriculum choices of high school students and employment level distribution in the labor force. Also, a serious disproportion exists between the number of students enrolled in a high school college preparatory curriculum and the number who actually enter and complete the four-year college program.

4. Employment Needs: Results of the recent skill survey conducted by the Department of Employment Security indicate that there will be a demand for 84,907 workers to meet expansion and replacement labor needs through 1971. In-plant training programs will provide only 5,600 workers leaving a training need in more than 79,000 positions.

At the completion of the present building program in 1969, vocational and technical education programs will be capable of enrolling 6,248 students and capable of graduating 2,493 trained students annually. When business education program graduates are added to this figure, a total of 6,275 trained students will be entering the labor force each year. Despite this substantial contribution to the skilled labor market, existing and presently planned vocational and technical programs will continue to fall far short of meeting the needs of students and industry.

5. Recommended Percentages of Secondary Students to be Served: It is recommended that Rhode Island's program of vocational and technical education be expanded to serve 17% of the secondary enrollment by 1970 and 20% by 1973. Such an objective is demanded by the State's projected economic and population growth, the diminishing need for unskilled workers and the personal needs of students. When compared with national data and studies from other States, the above percentages represent a realistic objective for Rhode Island.

6. Aid to Local Communities: Rhode Island has traditionally aided vocational and technical education in local communities through the reimbursement of operating expenses incurred by the vocational and technical program. As the number of programs increase and the demand on the property tax base also increases, it becomes more and more apparent that local communities will find it more and more difficult to financially sustain the quality programs envisioned for Rhode Island's area vocational and technical facilities. It is, therefore, recommended that aid to local communities for the operation of area vocational and technical programs be increased.

7. Distributive and Office Occupations Programs: Data from surveys and interviews with various Rhode Island business establishments indicate that one of the State's most rapidly growing occupational areas is in the field of product distribution. The surveys further suggest that we can anticipate a large increase in clerical and office related occupations.

It is therefore recommended that distributive and business cooperative education programs continue to be expanded in comprehensive high schools and that such expansion of local programs be encouraged by providing school districts with reimbursement from Federal and State funds.

8. Post-Secondary Programs: Data in Chapter III indicate that while 4,689 secondary students or 57.1% of the 1967 graduating class was enrolled in the college preparation curriculum, only 3,728 or 35.7% of these actually entered a four-year college. In addition to assisting the large percentage of students who prepare for a four-year college but do not attend, post-secondary vocational and technical education must be prepared to serve those students that will drop out of the four-year college (national figures show 50%) and those graduates of business, general and vocational and technical curriculums who desire a post-secondary education.

It is therefore recommended that facilities be developed to serve an additional 625 post-secondary students in 1973 and an additional 400 in 1975, and that the temporary campus in Providence be maintained until the proposed 625 student facility opens in 1973.

9. Adult Education Programs: Population data indicate that adults ages 23 to 44, the State's most productive working group, and the older working group, ages 45-64, will increase substantially. In view of rapidly changing technology, there will be a constant need for retraining and upgrading of the specialized skills and competencies of both of these groups if they are to remain competent and productive workers.

It is therefore recommended that aid to local communities for the operation of adult vocational and technical programs in area facilities be increased.

10. State Staff: During school year 1966-1967 a total of 2,007 students were enrolled in secondary and 220 in post-secondary vocational and technical education. With completion of the present building program and expansion of existing programs, a total of 5,684 students will be enrolled at the secondary level and 564 at the post-secondary level. Assuming expansion to the extent recommended, a total of 9,000 students at the secondary level, 1,589 at the post-secondary level, and 10,272 at the adult level can be accommodated.

It is therefore recommended that as program activity increases, the State vocational and technical staff be increased accordingly. Three professional staff members and two clerical assistants will be required by 1971.

## Financing the Recommended Program

The following assumptions were made in developing the financial projections contained in Tables 19-21:

1. Construction and equipment costs will increase at an annually compounded rate of 5.7%.
2. Operating costs will increase at an annually compounded rate of 5%.
3. Debt service will include an interest rate of 4 1/8% on outstanding indebtedness and principal amortized at the rate of 5% per year.

Table 19, Page 51, indicates projected capital expenditures necessary to implement recommendations 5 and 8 above. Recommendation #8 does not reflect the extent of need for all post-secondary education but, rather, indicates the capacity of facilities recommended for vocational and technical programs in accordance with the agreement between the Board of Education and Board of Trustees.

TABLE 19

PROJECTED CAPITAL EXPENDITURES

SECONDARY AND POST-SECONDARY VOCATIONAL-TECHNICAL EDUCATION

Secondary-Appendix C-1

| | | |
|---|---|---|
| Stage II | 1970-71 School Year<br>1524 Additional Students | $ 5,862,188 |
| Stage III | 1973-74 School Year<br>1792 Additional Students | 7,389,358 |
| | | $13,251,546 |

Post-Secondary-Appendix C-2

| | | |
|---|---|---|
| Stage II | 1972-73 School Year<br>625 Additional Students | $ 5,138,779 |
| Stage III | 1975-76 School Year<br>400 Additional Students | 3,713,850 |
| | | $ 8,852,629 |
| Projected Capital Expenditures | TOTAL | $22,104,175 |

The above funds can be provided as follows:

Bond Issue November 1968:

| | |
|---|---|
| Secondary | $ 5,862,188 |
| Post-Secondary | 5,138,779 |
| | $11,000,967 |

Bond Issue November 1970:

| | |
|---|---|
| Secondary | $ 7,389,358 |
| Post-Secondary | 3,713,850 |
| | $11,103,208 |

Projections of capital expenditures are based on recent estimates and actual expenditures for the constructing and equipping of facilities in Rhode Island's present building program and have been verified as far as possible by comparison with similar construction experiences in other States.

Stage II at the secondary level refers to providing facilities to serve 17% of the total enrollment by 1970. Stage III at the secondary level refers to providing facilities for 20% of the enrollment by 1973.

Stage II at the post-secondary level refers to accommodating an additional 625 students by 1973 and Stage III refers to serving another 400 students by 1975.

Table 20, Page 53, illustrates projected operating costs by type of expenditure and fiscal year through 1973. Projections are based on recent budget estimates and/or actual expenditures for operations.

It should be noted that while projected expenditures increase to a total of $7,732,546 in 1973, 35% of that amount or $2,731,210 represents debt service.

Table 21, Page 54, provides an indication of projected expenditure by fiscal year and source of funding. Federal funds have been conservatively estimated to remain constant because of the absence of any reasonable method of projecting an increase in such funding.

Details of computations used in arriving at amounts in Tables 19-21 can be found in Appendix C.

*OCCUPATIONAL HOME ECONOMICS; *PROGRAM DEVELOPMENT; PROGRAM PLANNING; FOOD SERVICE WORKERS; NURSES AIDES; POST SECONDARY EDUCATION; PREVOCATIONAL EDUCATION; HIGH SCHOOLS; *PROGRAM DESCRIPTIONS
MICHIGAN

In five communities in Michigan Home Economics-related occupational courses have been initiated at the secondary level. The report from Lapeer describes their training program for nurses aides. The dual program at Muskegon trains students to be food service workers, and offers general pre-employment preparation. Petroskey High School had a "Home Economics Occupational Orientation" class in 1965 and one in Hospitality Education in 1966. The Pontiac report describes their three occupational classes in home economics and the organizational framework in establishing them. The first two courses at Pontiac were for food service occupations and the third is a cooperative program related to the latter. The 2-phase Wayne program prepares food service workers. Grand Rapids has initiated three commercial foods courses, and two for "food supervisors" or school lunch managers and a commercial clothing class at the junior college level. The secondary schools offered vocational foods courses and a unit on job orientation. Reports from Alpina, Gaylord, Menominee, and Wyandotte, whose programs are in the initial planning stages, relate stages of implementation and decision making. Procedures for establishing such programs are described in VT 004 807. (FP)

# Ten Michigan Communities Report on Educational Programs for

# WAGE-EARNING OCCUPATIONS

## Related to Home Economics.

Professional Education Series H.E. 9
Home Economics Education

MICHIGAN STATE UNIVERSITY
College of Education • East Lansing

## ACKNOWLEDGMENTS

This is one of four publications which has been prepared as a part of the cooperative research project, "Procedures for Establishment and Evaluation of Training Programs for Wage-Earning Occupations Related to Home Economics," in which ten Michigan communities, the State of Michigan Department of Education, Division of Vocational Education, and Michigan State University have cooperated. The project was funded by the Division of Vocational Education for July 1, 1965–June 30, 1966; however, an extension of time was granted to June 30, 1967.

This report has been prepared for Michigan communities interested in occupational education related to home economics. It features progress reports from ten Michigan communities and includes a few suggestions or recommendations based on the experiences of the participants of the project and on the reactions of two evaluation panels.

While very deep appreciation is extended to all participants of the project, special appreciation is extended herein to the personnel in the ten Michigan communities who so generously have shared their experiences.

In this report each community has told its own story of progress made, procedures used, and problems encountered. Some communities have illustrated certain aspects of their programs through photographs.

It is hoped that this report may be useful to the ten communities participating in the project and to other communities interested in the possibilities, challenges and needs for expanding their home economics programs to include education for wage-earning.

May, 1967

BEATRICE O'DONNELL
*Project Director*

## PREFACE

The major purpose of this bulletin is to share with others some of the experiences of ten Michigan communities as they have attempted to meet the new challenge of expanding their home economics programs to include occupational education. Parts I, II and III include reports from communities in varying stages of program development. Part IV includes some suggestions and recommendations which the communities and members of the evaluating panels believe would be of help to communities interested in establishing home economics-related occupational programs.

Decisions as to what will be done in Michigan in implementing the recent national legislation in vocational education as it relates to occupational preparation rests in many places and in many hands: The Division of Vocational Education, State Department of Education; colleges and universities; community and junior colleges, technical institutes, area vocational and technical centers and local schools and communities.

In the area of occupational preparation related to home economics, present curriculum patterns are subject to controversy and a general feeling of uneasiness seems to prevail. This is true at the local community level, in institutions of higher education and at the state level.

Occupational education in home economics is new. The question is: How can this newest field build experiences, validate and refine procedures in establishing programs and in building new types of curricular offerings which provide for those most in need of occupational training?

The local school laboratory approach, combined with institutional workshops and clinics, appeared to have high learning value for all groups, especially for leadership in vocational education.

A project entitled "Procedures for Establishment and Evaluation of Training Programs for Wage-Earning Occupations Related to Home Economics" was selected for use. It was essentially a cooperative approach of teacher education, leadership in the

State Department of Education, Division of Vocational Education, and local action.

The project consisted of five phases: (1) preliminary planning and preparation; (2) workshop at Michigan State University; (3) the local community as a laboratory, (4) clinical sessions at Michigan State University; and (5) follow-up, evaluation and preparation of reports.

The project was exploratory for all participants. With the exception of the director of the project, the participants had no released time. Participants assumed the responsibilities involved in the research project as a part of their regular loads or on-going programs.

Members of the Advisory Committee were:

Dr. Lawrence Borosage, College of Education, Michigan State University

Miss Barbara Gaylor, State of Michigan Department of Education, Vocational Education Division

Mr. Charles Langdon, State of Michigan Department of Education, Vocational Education Division

Dean Jeanette Lee, College of Home Economics, Michigan State University

Dr. Rosalind Mentzer, College of Home Economics, Michigan State University

Dr. Beatrice O'Donnell, College of Education Michigan State University

Mrs. Rex Tood Withers, State of Michigan Department of Education, Vocational Education Division

The Advisory Committee actively assisted in the various phases of the project including: recommending schools or communities to be invited to participate in the project; reacting to materials prepared as a part of the project; recommending and securing consultants as needed; recommending and approving plans for the summer workshop and the spring clinical sessions; evaluating the project.

In April, 1965, communities recommended by the various members of the Advisory Committee were sent invitations to participate in the project. The recommended communities, in the opinion of the committee members, reasonably met the criteria which had been defined as important: (1) interest in and readiness to participate in such a project; (2) representativeness in size, character

of local community, socio-economic factors and occupational complex as interpreted by range (3) availability of leadership.

The ten communities accepting the invitation to participate were: Alpena, Gaylord, Grand Rapids, Lapeer, Menominee, Muskegon, Petoskey, Pontiac, Wayne and Wyandotte.

Of the ten communities participating in the project, several had "wage earning programs" already launched. During the project these communities continued to develop their programs and shared generously and thoughtfully their past and continuing experiences.

During the final visit to the participating communities in May, 1967, local teams were asked what they had learned about establishment of programs for occupations related to home economics, which they believed would be of value to other communities and should be included in the bulletin, "Ten Michigan Communities Report."

The Advisory Committee members and other specialists in vocational education assisted in reviewing the project and the research results. Two evaluation panels, one at Wayne State University and one at Western Michigan University reviewed the project and participated in a conference in their own institutions to assist in synthesizing the findings and indicating directions or emphases for home economics occupational education in the years ahead.

The members of the evaluation panels were:

Dr. Willard Bateson, Wayne State University
Dr. Margaret Brennan, Western Michigan University
Dr. Eunice Herald, Western Michigan University
Dr. Gordon Johnson, Western Michigan University
Mrs. Bette LaChapelle, Wayne State University
Dr. George Leonard, Wayne State University
Dr. Marian McMillan, Wayne State University
Mrs. Gladys Rowe, Western Michigan University
Dr. Harold Silvius, Wayne State University
Dr. Robert Wurtz, Wayne State University

The suggestions and recommendations from the various groups have been included in Part IV.

## PART I

# Reports from One Community in which Home Economics-Related Occupational Courses Have Been Launched

## REPORTING FROM GRAND RAPIDS

The progress which has been made in Grand Rapids in the development of education for employment in home economics-related occupations has been described under three major categories: (1) progress made at the post-high school and adult levels; (2) progress made at the secondary school level; and (3) plans for the future. *Integrally related, has been in-service education of potential teachers of occupational education.*

The report of progress is organized in such a way as to show: (1) the early approaches and steps; (2) the sequence of course offerings; and (3) the parallel program of in-service education of teachers to staff proposed programs.

### Commitment to Occupational Education

In the summer of 1964, in order to add to her experience in this new dimension of home economics, Eleanor Tumath, Supervisor of Home Economics and Family Life, attended a workshop devoted to wage-earning programs related to home economics held at Iowa State University, Ames. This workshop was directed by Rua Van Horn, nationally recognized leader in home economics and occupational education. She also attended two workshops on home economics occupational education at Michigan State University in the summers of 1965 and 1966. At the workshop in 1965 she developed some tentative long time goals and some specific plans for 1965-67, for the Grand Rapids Program.

Because of the nature of her responsibilities, Miss Tumath was able to use the flexibility available in her time schedule for involving groups, interpreting needs, and initiating occupational education related to home economics.

## Progress Made at Post-High School and Adult Levels at the Grand Rapids Junior College

### First Course: Commercial Foods, Spring, 1965

The first course in home economics-related occupational education in Grand Rapids was offered at the Grand Rapids Junior College. The course was a response to a request made by management personnel in the food industry, which included representatives of hospitals, restaurants, hotels, and department stores operating tearoom services. It focused on the upgrading of persons employed in the food industry.

The course was entitled "Commercial Foods." There were nineteen in the class—thirteen were from the foods industry and six were Grand Rapids home economics teachers who were potential food-service teachers for the secondary school program. The six home economics teachers participated in this course as a part of the in-service program, and the Grand Rapids Board of Education paid their tuition.

The instructional staff consisted of personnel with wide food service occupational experience. Instruction in the course focused on food merchandising from the quantity standpoint. The basic method of instruction consisted of demonstrations and laboratory experiences.

The class met for a three-hour session once a week for seventeen weeks.

### Second Course: Commercial Foods, Fall, 1965

The second course, Commercial Foods, was a continuation of the first course for some class members and a new experience for others. There were twenty-two in the course—sixteen from the food industry plus the six potential food service teachers who were enrolled for the first course.

The group continued to meet for a three-hour session, once a week for seventeen weeks. The instructor, George Bower, was a commercial chef who had occupational training in Europe. The basic method of instruction consisted of demonstrations and laboratory experiences.

### Third Course: Commercial Foods, Spring, 1966

The third course focused on quantity baking. The instructor, Henry Vandemark, was a baker at the Butterworth Hospital. His training also had been in Europe.

The group was composed of twenty-two persons who had been enrolled in the first and second courses and some new members.

The basic method of instruction continued to be demonstrations and laboratory work. During this course, the special equipment made available through vocational education funds was installed in the food laboratories and used in the course.

**Fourth and Fifth Courses: Food Supervisors, Fall, 1966; Winter, 1967**

The fourth and fifth courses were planned for Grand Rapids school lunch managers. Managers from other school systems were admitted in a few situations. For these courses enrollment had to be limited to a smaller group than was permitted for the commercial foods courses described above. Thirteen school lunch managers were enrolled for both the fall and winter courses.

In the fourth course, Cafeteria Management, instruction emphasized management and record keeping. In the fifth course, instruction emphasized techniques of quantity food preparation with laboratory experiences.

The instructor was Eleanor Tumath, Supervisor of Home Economics, Grand Rapids Public Schools. Many resource persons with commercial foods backgrounds and experience participated as part of the instructional staff.

**Follow-up**

No follow-up has been made at this time to determine the effectiveness of the upgrading courses for food service workers.

**Sixth Course: Commercial Clothing, Fall, 1966**

In the fall, 1966, a commercial clothing course was offered at the Grand Rapids Junior College, for home economics teachers interested in the possibilities of teaching commercial clothing, especially clothing alteration.

The course was taught by the head alterationist, Marian Warwick, employed at Skeketee's. Mrs. Warwick had thirty-five years of experience in clothing alteration and making fine garments.

The enrollment for this course was limited to twelve. The course consisted of seventeen sessions of three hours each. Three semester hours of credit were given for the completion of the course requirements.

This course was offered because evidence of need had been established in Grand Rapids through a special study conducted by

Patricia Rasch. Key men and women in the retailing field in department stores, discount stores, and specialty shops were interviewed by Mrs. Rasch.

The method of instruction consisted of demonstrations and laboratory work in the classroom and some observation in the alteration department at Skeketee's under the guidance of the instructor.

The content of the course included: general introduction to the alteration processes; changing the hemline; waistline alterations; how to correct faulty necklines; altering shoulders and sleeves; special techniques; study of fabrics.

The following is a summary which was made by one of the class members.

> It has been our aim to learn as much as possible about the work of altering clothing using methods that are used in department stores. While it is true that each garment that needs alteration will present its own problems, we feel that if you understand the principles of what makes a garment fit well, can sew straight and if you follow instructions given for solving of basic problems you should produce fine results.
>
> We do feel that to become efficient in the alteration of clothing, a work-study program, whereby the student could gain the knowledge of procedures in class and the experience in an alteration department, would be the very best total learning situation.

## Progress Made at the Secondary School Level

### Unit on Job Orientation, Fall, 1964

A unit of instruction on occupational orientation has been included as a part of the elective course, Personal Regimen, offered in all the Grand Rapids high schools at the eleventh and twelfth grade level. In 1965-66, 125 students were reached through this course. This procedure was also followed in 1966-67, with approximately the same number of students.

### Discussions with School Administrators and Advisory Committee, Fall, 1964

The Supervisor of Home Economics worked with the Director of Instruction and the Director of Vocational Education in exploring the possibilities of offering occupational courses related to home economics.

She presented the need for occupational classes related to home economics to the secondary school principals at one of their regular

meetings. The principals expressed interest and Creston High School was chosen as a pilot program center for a commercial foods course.

An Advisory Committee was set up to help in making the general course outline. Members of the Committee offered their businesses as field trip possibilities and expressed a need for such a program.

**Vocational Foods Course at Creston High School, February, 1965**

A course entitled "Vocational Foods" was offered the second semester, 1964-65, for eleventh and twelfth grade students. There was a total enrollment of twenty, including both girls and boys. The teacher and counselor together selected the students for this course. The course was taught by Betty Adloff, who had been enrolled in the three previously described commercial foods courses which were offered at the Junior College.

The class met two hours a day for five days a week. Students received ten credits, or one credit for each hour spent in class. The class met in the home economics laboratory, and instruction consisted of demonstrations and laboratory experiences. The class members also rotated positions at the different work stations in the laboratory and school cafeteria.

**Continuation of the Vocational Foods Course 1965-66 and 1966-67**

The course, Vocational Foods, which was initiated in February, 1965, at Creston High School, has been offered for both semesters for the two years, 1965-67.

In addition to classroom instruction and laboratory work each student works in the school cafeteria at different stations getting varied experiences.

In 1965-66, there were fifty-three students enrolled, about half of whom were boys. In 1966-67, there was an enrollment of thirty-five with about one-third being boys. Students were generally in the eleventh grade.

In the fall, 1966, Creston High School was asked to participate in a research and development project on hospitality education, a curriculum development project, Michigan State University.

Betty Adloff, the home economics teacher responsible for the course at Creston High School, serves as a research associate in the project and in this role spends one period a day on the project. For one semester, the project reimbursed one period of the

teacher's time devoted to the project. After the first semester the Grand Rapids Board of Education assumed financial responsibility for this one period devoted to the project.

### Vocational Foods Course at Union High School, 1965-66

The Vocational Foods course was added at Union High School in 1965-66. This course was primarily for eleventh graders. Enrollment in the course in 1965-66 and in 1966-67 consisted of eighteen girls and two boys. The teacher was Helen Depuitt, who also had been enrolled in the three previously discussed commercial foods courses at the Junior College. The methods and content of the Vocational Foods course at Union High have been the same as those at Creston High School.

### Follow-up

Follow-up studies will be made of the vocational food service courses at Creston and Union High Schools in 1968 after students have completed the two-year vocational foods program.

## Plans for the Future

### Grand Rapids Junior College: For Post-High School Youth and Adults

Four types of plans seem to be in the process of implementation in the near future:

1. *Establishing a terminal food service course at the mid-management level.*
   This would be a part of the day-school program at the Junior College.
2. *Expanding the night or evening school program, including an increase in offerings and sections.*
   There have been requests for this type of expansion
3. *Offering an associate degree in occupational education focused on the cluster of child care and development services.*
   This program would be open to post-high school students and adults.
4. *Incorporating commercial clothing construction processes in regular clothing classes.*
   Instead of offering again the commercial clothing alteration course, the content would be incorporated in the regular clothing classes.

## Secondary School Level

Plans for the future include the following:

1. Continue the vocational food service course at Creston and Union High Schools.

2. Expand the vocational food service course offerings
   The vocational food service course would be added to South High School and possibly at Central High School. It would be offered at the eleventh grade level.

3. Use a coordinated plan for the two-year food service program
   *First year.* The first year of vocational food service would be offered at each of the four high schools.
   *Second year.* In the second year, students would be bussed to Union High School, the Area Vocational School in Grand Rapids. Union High School is equipped with a commercial foods room. The instructor in this school would be an institutional administration major.
   The second semester of the second year would be Co-Op training and the coordinator would be the foods instructor in the area vocational school.

4. Explore the possibility of moving into some type of home and community service course.
   This course would be geared to occupations requiring limited skills, with initial steps consisting of exploring possibilities within regular home economics courses. Effort would be made to develop such a program so it would have "prestige" within the school and community.

## PART II

# Reports from Five Communities in which Home Economics-Related Occupational Courses Have Been Launched at the Secondary Level

## REPORTING FROM LAPEER

In the fall of 1966, Lapeer Senior High School, Lapeer County General Hospital, and Lapeer State Home and Training School combined efforts in preparing non-college bound girls for post-high school employment as nurse's-aides.

The major objective of the Cooperative Nurse's-Aide Program is "to develop a well-trained nurse's-aide, who can work in various capacities." "Various capacities" is interpreted to be in a hospital, a nursing home, a doctor's office, a clinic, or as a ward secretary.

Results from a recent vocational survey indicate that Lapeer County has an increasing yet stable population. The health field continues to be a major employer within the community. Upon graduation from high school many of the non-college bound students find themselves with insufficient training for any specific job or occupation. The cooperative nurse's-aide program is intended to meet the needs of some of these students.

### Requirements and Responsibilities of Students

The Nurse's-Aide Program is open to senior girls who have met the requirements for graduation, have good citizenship records, and have an interest in a service vocation. They must also secure their parents' permission to participate in the three hours a day, five days a week program. The candidates are screened by the home economics teacher, who is the coordinator for the program.

Since the basic purpose is to provide a learning situation and not a service to potential employers, the number of students en-

rolled was limited to the ability of the cooperating hospitals to accommodate the students with supervision by licensed registered nurses. A maximum of twenty-six was set. There are nineteen students enrolled for 1966-67.

Each student nurse's-aide wears a uniform which designates her as a participant in the program. The uniform consists of a yellow-and-white-striped pinafore; short-sleeve white blouse; white-soft-soled shoes; and a watch with a sweep second hand. Each girl is responsible for her own uniform.

The instructional program includes (1) a variety of experiences in the hospital; (2) a nursing arts class taught in the hospital; and (3) a related health class taught in the high school.

**Practical Experiences at the Hospitals**

One-half of the student's school day is spent at the hospital, either in class or in gaining valuable experience. Mornings were found to be more practical for learning experiences as a large portion of patient care takes place at that time of day.

The students are divided into two groups for their practical experience. Six students are assigned to the smaller hospital and thirteen to the larger one.

Students participate in the regular orientation programs at their assigned hospitals in order to acquaint them with facilities, personnel, and policies. Each student keeps a notebook type of log which contains a record of class work and experiences encountered in each area of service. Each log is characteristic of the individualistic way in which we all see similar situations.

The rotation system is used to allow the student more opportunity for wider experience in the various units. Although there are two hospitals participating in the program, care is taken to see that similar types of units and experiences are provided for both groups.

**Nursing Arts Class**

Instruction in nursing procedures is given weekly to the students by a registered nurse. She is assisted by two other registered nurses, one from each of the participating hospitals. The students are evenly divided into two sections, meeting on separate days to allow for more individualized instruction and supervision of each procedure taught.

A classroom was set up on the presently unfinished third floor of the County General Hospital due to a lack of available space at the high school. The large equipment used in the classroom was

furnished by the local school system. Small equipment and laundry were furnished by the hospital. Classes are three hours in length, which allows for presentation of procedures and time for students to practice.

**Related Health Class**

Upon returning to the high school, the student goes directly to a health class. This class, taught by the high school home economics teacher, supplements the hospital class with anatomy and physiology of the human body, foods and nutrition, expenses of illness, personality development, and spiritual needs of the patient.

**Stipend**

Each student receives a small stipend from the hospital where she is receiving her training. Students are responsible for their own transportation between school and both hospitals.

**Special Certificates at Graduation**

At graduation in the spring of 1967, the students were presented special certificates which described the program which they had completed. The certificate served as a reference to their experience and abilities as a qualified nurse's-aide. Each student was eligible and qualified to seek employment in this capacity or, with further training, in other phases of hospital work.

*Staff and students in the Nurse's Aide program, 1966–67. Staff members are (front row, starting second from left): Mrs. JoAnn Roberts, R. N.; Mrs. Abi Warner, R. N.; Janet A. Morton, home economics teacher and coordinator of program, and Mrs. Germaine Daunt, R. N.*

*Nursing Arts supervised practice.*

*Laboratory work.*

*Working in Pediatrics.*

*Assisting patient in medical unit.*

*Nursing Arts class in the hospital.*

## A Student's Description of the Orientation Experience

Brenda Conger, student nurse's-aide, homemaking career, shared the following report of her orientation experience.

During our two weeks of orientation, six girls out of a class of nineteen went to the County General Hospital and met with three nurses, Mrs. Warner, Mrs. Roberts and Mrs. Daunt.

The first couple of weeks Mrs. Roberts showed us the various departments. Some of the many departments that were shown to us were the Business department, the Laboratory, the Housekeeping, X-Ray room, Maintenance and many more.

We were taken to the floors and were shown where various things were kept, such as the linen closet, the flower room, the utility room, etc.

We were shown where to change our clothes and where to keep our school clothes. This place is in the girls' locker room in the basement.

We were shown how to use the time clock and were told to use it everyday, whether we worked or went to class. We have class on the third floor of the hospital.

For a couple of days we shadowed the nurses and watched how they went about their work.

We had flu shots and we found out what our blood type was. We also had our pictures taken so that the employees could see who were the new six student nurse's-aides.

We wore our yellow and white uniforms with white blouses and white nurses shoes, and name tags.

All in all, it was a very interesting orientation. I know that the six of us enjoyed it very much. I know that we all will like our training there. The nurses seem to enjoy having us work with them.

One of the nurses commented "You girls will make fine nurses someday, so keep up the good work."

## Follow-up

Several of the girls who are completing the nurse's-aide program, spring, 1967, have been accepted in nursing programs to continue their education. A follow-up study will be made in 1967-68.

## Interpretation to Parents and Potential Nurse's-Aide Enrollees

Girls who were completing the nurse's-aide program, spring 1967, and their parents were invited to a "special tea" in the Home Economics Department at which time the students were honored and the program explained.

Potential or interested enrollees in the nurse's-aide program for the following year (1966-67) and their parents were invited to an informal get-together in the Home Economics Department. Again the nurse's-aide program was explained and there was an opportunity to ask questions.

## REPORTING FROM MUSKEGON

The report of the Muskegon County Vocational and Technical Committee in October, 1965, showed that Muskegon High School was the only school in Muskegon County in which occupational education or wage-earning preparation was a part of the total home economics program.

The report indicated that (1) 70 percent of the youth in Muskegon County who are graduating from the secondary schools are in need of training programs at either the secondary or at the thirteenth and fourteenth grade levels to provide them with saleable skills; and (2) another 28 percent of the youth who enter the ninth grade but never graduate from high school are in need of the opportunity to be trained in a saleable skill and should be encouraged through greater opportunity to stay in school. The report further points out (1) the needs of the employment-bound girl and some occupations in which there are employment opportunities for her and (2) the need for increased vocational guidance to inform youth of the many employment opportunities open to them.

### Program at Muskegon High School

The Muskegon High School Home Economics Department has been experimenting with two courses in wage-earning preparation. One course is Food Service and the other is Wage-Earning in Home Economics, sometimes referred to as Pre-Employment Practice, or P.E.P. class. This has been a challenging attempt to help the work-bound high school student to learn a wage-earning skill.

The classes each meet one hour a day, five days a week, for one semester. The Food Service class also includes the noon period.

While each of the two courses has its own purposes and content, both courses place emphasis on improving attitudes toward work and opening up job opportunities. In both courses the methods of instruction include as many real experiences as possible through laboratory practice, demonstrations, field trips and contacts with "important" resource persons. Visual aids are used extensively to overcome language barriers. These methods seem especially appropriate, because the students in these classes tend to be "non-readers" and/or "low-achievers."

Because of poor reading comprehension, much interest and knowledge are gained also through making and showing trans-

parencies with the overhead projector, film strips, slides, posters, bulletin boards, newspapers and current magazines.

Generally, many of the students' attitudes toward the world of work need changing. Unfortunately, some young people have not experienced seeing members of their own families or neighbors regularly employed. In some cases, no one in the family may have worked for a living. The importance of a job and constructive attitudes toward work are stressed in both courses. The need for this emphasis was supported also by the responses of parents and employers in the Muskegon County Vocational and Technical Study.

Role playing helps students to learn how to accept criticism and to cheerfully follow directions given by those in authority. The art of being diplomatic, dependable, prompt and honest are kept in the foreground by constant practices.

Many areas of jobs are unknown to some of our boys and girls. The Michigan Employment Security Commission, restaurant owners, managers, kitchen workers, waitresses and others have taken time to advise us. MESC has given us various helpful leaflets. We try to acquaint our work-bound pupils with work-bound, or good, employment policies.

*Efficient and sanitary methods of preparing quantity food are emphasized.*

*Attractive and efficient serving of food to guests depends on team work.*

**The Food Service Program**

A food service course was first offered at Muskegon High School in the spring of 1965. The course is a one-semester course, but it can be taken again if a student makes this choice. The course was offered both semesters in 1965-66 and again in 1966-67. Enrollment in the course has increased from sixteen to twenty-six. There may be the possibility of limiting the enrollment.

Instruction in the food service course focuses on quantity food preparation and food service, using a "tearoom" style with invited guests part of the time. The students man different job stations for a week at a time. This gives the food service aides a variety of typical commercial experiences. Many types of food services are used and practiced. Sanitary housekeeping methods and the necessity for safe handling of food are routine in our large quantity food preparation. Accident prevention and first aid films emphasize lessons on being alert and on the correct use and care of equipment.

Special field trips provide enriching experiences for the food service classes. Students have visited bakeries, and kitchens in local restaurants and hospitals. In a tour of a well-organized institutional food preparation facility of a local hospital they have seen: (1) nourishing food being prepared; (2) food being attractively arranged on the patients' trays and (3) food quickly distributed throughout the various floors of the institution under the most sanitary conditions.

In a restaurant in which the class was being conducted through the kitchens, reservations were made so that students could be served in the dining room and where they could continue their observations. This seemed important because some students have never eaten in a restaurant.

Some emphasis is placed on good grooming in the food service, as well as in the wage-earning course.

A follow-up study of placement and employment of our students finds them in food service work in hospitals, nursing homes, dining rooms, restaurant kitchens, and lunch counters. A few are working part time while attending college. One boy is in charge of the galley on board ship.

**Wage-Earning Class in Home Economics**

The Wage-Earning Class in Home Economics, or the Pre-Employment Preparation course (PEP), was first offered in the spring of 1966 and offered again in the spring of 1967. It is open to students in tenth to twelfth grades. Students are not screened for entry into this course. Thirty-one students each semester have been enrolled in this course. Some students are enrolled in both the Food Service course and in the Wage-Earning Class in Home Economics.

In the wage-earning course, emphasis is placed on good grooming and appropriate ways of dressing, especially for an interview and on the job. Good grooming was introduced through the use of pamphlets. Each student participated in a manicuring lesson. This gave us the opportunity to emphasize keeping the hands and nails immaculate. Here again resource persons are a real asset. A representative from a beauty school gave demonstrations of hair styling and attractive make-up. On another occasion a lady showed us how to dye shoes and stressed the importance of comfortable well polished shoes. The owner of a local haberdashery, in visiting one of our classes, displayed the correct ways of dressing for an interview, on the job and for social affairs.

In the wage-earning course, emphasis is placed on several types of saleable skills which might help in securing initial employment. Instruction is provided in: (1) child care; (2) home nursing; (3) simple home meals; (4) simple serving; (5) housecleaning and (6) alterations. The classes have had guided tours to a hospital which adjoins our central campus. They have had a visit to the Child Day Care Center. These are favorite experiences. In the Child Day Care Center students enthusiastically observe the types of toys,

small scale equipment, cots, tiny bathrooms, tables, chairs, eating arrangements, play areas, story telling time, etc. Here our students have an opportunity to compare the development of children at different age levels. They admire the affection and respect between the tiny tots and their instructors.

## The Cooperative Program

The report of the Vocational and Technical Study indicated that "present the only cooperative training program being conducted in the Muskegon area is being operated by the Muskegon Public Schools. During the past few years, the fringe area schools surrounding Muskegon have been participating in Muskegon's program on a tuition basis. However, transportation difficulties, lack of numbers and reluctance of some schools to pay tuition fees have kept outlying schools from participating in this program."

This report also indicates that another problem is the number of enrollees per coordinator. "Programs tend to lose quality in training when numbers of enrollees get to the size which prevents coordinators from making frequent checks on employment training stations."

Ruth Ingalls, the home economics teacher responsible for teaching the two wage-earning preparation classes at Muskegon High School, has been allocated part time to assume some responsibilities in the cooperative program.

## The Future Challenge

In the organization of the Muskegon County Vocational and Technical Study, there was a sub-committee on the "Employment-Bound Girl." Ruth Ingalls, Muskegon High School, was a member of this committee.

The committee reported some interesting findings and made some recommendations in the chapter "Employment-Bound Girl—A Problem Area."

The committee reported that (1) the unemployment rate in the Muskegon area was high for the female and that occupational programs should consider the needs of the employment-bound girl; (2) there is a need for female workers in a wide variety of occupations; (3) there is a positive effect on alleviating shortages of workers by upgrading the names of the occupations and by popularizing occupations; (4) there is a need for vocational counseling to inform

youth of the many opportunities to be found in employment in the areas identified.

The committee listed areas in need of female workers in Muskegon communities. A glance at these shows that many are related to home economics. The following is a complete list of the areas in need of female workers. However, in this report they have been alphabetically listed and are reported in a manner to save space.

AREAS IN NEED OF FEMALE WORKERS IN MUSKEGON COUNTY

| General Classification | Specific Types of Jobs in Services |
|---|---|
| 1. Food Industries | Salad makers; catering; baker; assistant baker; cooks; substitute cooks; specialty restaurant operator; trucking meals |
| 2. Health Occupations | Lab technicians (non-registered); aides for elderly care; hair dressers for elderly; nurse's aides; orderly |
| 3. Homes (Individual) | New mother's helper; convalescent care; home aid; housecleaning; companion; temporary cook; temporary pet care; gardening |
| 4. Manufacturing (Clothing) | Machine operators; alterations; tailoring |
| 5. Manufacturing (Foods) | Food packer; sorting for preparation; inspectors |
| 6. Merchandising | Sales in specialized area (fabric); buyers; window displayers; storewide advertising; display assembling; toy assembling; commercial art; advertising layout; personal shoppers for homebound; part-time florists. |
| 7. Office | Offset machine operators |
| 8. Recreation | Organizers of children's activities; party planning service |
| 9. Resorts | Housecleaning; maids; babysitting services; vacation cooks at cottages |

## Occupational Orientation at Steele Junior High School

Helen Funk, home economics teacher at the Steele Junior High School, has been interested in exploring what could be done to help possible drop-outs to stay in school and to be more realistic about their futures. She made some plans at the workshop at Michigan State University, summer 1965, for trial use.

**Bulletin Board and Discussion Approach**

In the 1965-66 school year, we found it advantageous to have a special group for one of the ninth grade sections of home economics. This group was composed of low achievers, and were for the most part potential drop-outs in our school system. Most of these girls had low aspirations. In addition, many were from a disadvantaged group—financially, socially, mentally, or a combination of these three.

The two goals with this group were: (1) to increase their awareness of the several or multiple roles of girls and women, especially the roles of wage-earning and homemaking—and to help them see themselves as assuming these roles; and (2) to help students develop the desire to stay in school.

Since this was a home economics class, and since the girls would probably be employed in certain home economics-related occupations, it seemed important to help them see the wide range of home economics and health-related occupations which are open to them.

The discussion began with their plans for the future as ninth graders, high school, college or further training, wage-earning employment, marriage, a family, and the probability of re-entering the work force after the establishment of a family. The bulletin board was used to introduce "the topic for the week," with the discussion following on Friday of that week.

There were sixteen girls enrolled in this class. The method was found to be effective and considerable interest was aroused. Discussions were brief with interesting bulletin board materials.

**Follow-up**

As of 1966-67, of the sixteen girls enrolled in this class, one is married, three are drop-outs, and the rest, or 75 percent, are in high school. This has reinforced my belief that something must be done to provide occupational information related to home economics and health occupations in the junior high school, especially in relation to opportunities in the local community.

**Plans for Eighth Grade, 1966-67**

Plans during 1966-67 have included extending the experiences which were provided last year for ninth grade girls to the required home economics course for all eighth grade girls. A few days would be devoted to orientation to occupations which are categorized as home economics or home economics-related.

Interesting magazine articles written for young girls, which are well illustrated, have been collected and will be used with this class.

It is interesting to note that in the Muskegon County Vocational and Technical Committee Report it was recommended that opportunities to learn about health occupations should be provided in the "lower grades."

## REPORTING FROM PETOSKEY

Petoskey is a small town on the shores of Little Traverse Bay in the heart of the Michigan tourist region. Citizens and educators in Petoskey were concerned as to whether the educational needs of their young people were being fully met. They wanted their youth to have equal opportunity to compete in today's modern society. Geographically somewhat isolated from the larger urban areas, the young people were nevertheless exposed to many thousands of tourists who enjoy both the summer and winter recreational facilities.

With this exposure, some individuals began to ask questions: "Why do our non-college bound youth have to leave our area following high school graduation to seek employment when, paradoxically, it is becoming increasingly difficult for local employers to hire reliable personnel? Are high school graduates prepared for the jobs they seek? Can they compete with those young people who have had vocational training in the urban areas? Why has the problem of finding people for such service positions as household helper, child care assistant, or food service worker, become so much greater now than formerly? What can or should be done about it? What is the school's responsibility?

Mrs. Gerald Drake, the first woman on Petoskey's Board of Education, was indeed concerned about the school curriculum and very persistent about getting things done. Over the years, she had known the home economics teacher, had been in education classes with her and had often talked informally over the telephone, or face-to-face, about the possibilities for curriculum changes.

Several factors probably contributed to the final impetus that completed the social action. First the Emment County School Study of 1962 pointed out the unequal educational opportunities for all pupils in the county and made recommendations for one

county high school, which could offer a broader curriculum than has been possible in the individual small schools.

The Vocational Education Act of 1963 emphasized the importance of occupational training related to home economics in addition to education for homemaking and family living.

The area study, "Improving Vocational-Technical Education in the Top O'Michigan Area" showed that a higher than national average number of women in the Petoskey area found it necessary to seek employment outside the home. This necessity was further explained when the study revealed that 25 to 35 percent of the buying income in 1959 was less than $3,000 per household.

In the spring of 1965, or at about the time Petoskey agreed to be a participating community in the "cooperative research project," the opportunity was provided the home economics teacher to have one hour of her class schedule for this new dimension of occupational preparation related to home economics.

The community of Petoskey was also in the process of building a new area vocational school, which would take care of tenth through twelfth grade students from Petoskey and students from other communities in the area, who wished to avail themselves of the opportunity to enroll in vocational subjects.

Marcia Miller, the home economics teacher, talked over occupational education related to home economics with the superintendent of Petoskey Schools, the principal of the high school, the director of vocational education, the co-op coordinator and the school counselor. She discussed plans and secured reactions, suggestions and support for the new occupational orientation course which would be offered in the fall, 1965. A counselor assisted by explaining the new course to prospective students.

*Marcia Miller discusses proposed programs with Oliver Aho, principal (center), and with K. Dale McAlvey, director of vocational education (left), and Clifford Buckmaster, Co-op coordinator (right).*

*Mrs. Gerald Drake, and other Board of Education members, supported the new program.*

## Home Economics-Related Occupational Program, Petoskey High School

### First Course: A Home Economics Occupational Orientation Class, 1965-66

One year prior to the move into the new school, the home economics teacher secured the cooperation of the administration and the State of Michigan Department of Education, Division of Vocational Education, to offer a one-year exploratory orientation course called "Home Economics-Related," referred to as H.E.R. The major purpose of this course was to help students understand the occupational or vocational opportunities related to home economics. Emphasis would be placed on exploring those occupations open to the non-college bound student and for those pertinent to the locality. It was also hoped that information thus gathered would give direction or assist in decisions about the future curriculum offerings.

Twenty-two junior and senior high school students elected to take this course in the fall of 1965. The teacher and the students together gained much in their understandings about the opportunities in occupations related to home economics and the requirements of workers and their methods of entry into the occupations.

Field trips were made to the Michigan Employment Security Commission; Boyne Highlands—a recreational resort; Petoskey Beauty Academy; Little Traverse Hospital; Hooker's Laundry

*(Above) Ruth Kalkrenner, counselor, explains the new home economics occupational orientation course to a prospective student. (At left) A former student of the course is employed as an Aide in a geriatric care center.*

and Dry Cleaners; and the Bell Telephone Company.

Special speakers included: the Administrator of the County Extended Medical Care Center; the Director of the Nursing Program, Community College; the Director of Social Security; the local Director of Vocational Education; the local Co-Op Coordinator.

Students also kept a running record of the employment advertisements in the newspapers for the year.

Generally, interest of pupils in the class remained high. The teacher had some difficulties in locating materials and teaching aids suitable for such a course. Some materials are not at the reading level of the majority of class members and some are not useable. Career materials are mainly geared to the college bound and professional levels. Occupations for men were favored. There was very little at the semi-professional or technical level.

**Follow-up of Graduating Seniors**

The most rewarding moment was when a follow-up study revealed that among the H.E.R. students who graduated from high school, spring 1966, only one was unemployed. One was employed at the Geriatric Care Center, two were maids at a tourist-recreation area, one was in restaurant work and two were clerking. No study was made of the eleventh grade students.

## Student Evaluation of the Course

Student evaluations of the course were for the most part favorable. The teacher was somewhat disappointed that she had not succeeded in helping some of the students to modify some of their unrealistic vocational goals. Below are some of the student evaluations:

### Student I

At the beginning of the year I was interested in and planned to work in the food service field. I still plan on working in a food service field job. This course has encouraged me more in this field. My summer plans are to work as a hotel maid or work in a hospital. Most of the jobs we studied about were related to home economics. It could be a shorter course. There also should be more group projects.

### Student II

I wanted to work full time in the Petoskey Geriatric and Care Center. I have not changed my mind about what I plan to do after school. I think the course should be a years course because you can learn many new things in a years time. My plans for the summer are to work and save money to help put my sister through school. I learned a lot of things in this class. One thing we learned is how to apply for a job. There is nothing I would suggest to improve the course.

### Student III

I planned on going into the Navy and to be a Wave or to run a nursery for little children. I haven't changed my mind yet. I think the course should be offered for one year for ninth, eleventh and twelfth graders. I don't think you would learn as much if you had it as a part of another course. My summer plans are to work at Circuit Controls (a factory) and earn enough money so I can come to school next year. After I graduate I plan to go into the Navy. I learned about the different kinds of jobs all over the world, how to apply for them, what to wear and manners. I really don't think it needs any improvement.

### Student IV

My plans were to go to beauty school and I had already signed up for it. I start in December. I have not changed my mind but after we have studied all of the different careers I thought maybe I would like to go into some area of the food service. I feel that 10th graders should take it and it might help them to know what they really want to do. It would help them to pick their classes in the field they would want to go in. I think it is a whole year course. You couldn't learn everything in a semester or a unit in another class.

### Student V

I wanted to be a nurse to work in a Care Center for older people. I have changed my mind. To be a nurse would mean more education and school. I don't want to think about that. I am going to work at the Hub as a waitress. The course should be offered in 9th and 10th grades. It should be a years' course. I work at the Hub. Next year I plan to work again and save money. I learned what jobs were more available than others. I learned about jobs in which most women work. I would like more field trips and more speakers.

**Second Course: Hospitality Education, 1966-67**

Because of the groundwork laid during the teaching of the Home Economics-Related Course, and because of the number of job openings in the food service industry, the teacher felt that they were indeed fortunate to be selected as one of the seven pilot schools in Hospitality Education. They were to participate in a two-year developmental program in food services as part of a research project sponsored by Michigan State University.

Eleventh grade students were enrolled for a two-hour class, combining classroom and actual job experience in the school cafeteria. During their senior year these students will be placed in commercial food places during part of their school day for a co-operative experience.

Sixteen girls and two boys are enrolled in this course. It began in the fall, 1966. Four of the students, or 25 percent, are former members of the H.E.R. class, taught the previous year.

Teaching the class is the cooperative effort of the home economics teacher and the Director of Food Service. The home economics teacher has been given an additional hour in her schedule to act as a research associate for the project and keeps records and reports as they develop in the curriculum.

An advisory committee of key people in the tourist business has been selected and will work very closely with the Director of Vocational Education, administration, and staff in developing a curriculum which will best serve the needs of our area. The committee

*An advisory committee helps to plan the hospitality education program.*

*A hospitality education student at local hotel.*

includes a hotel manager, two restaurant owners, a hospital dietitian, former instructor of a cook's school under the Manpower Training and Development Act, and the Secretary of Commerce.

### A Challenge to Home Economics Teachers

The home economics teacher is indeed proud to be a part of a school and community which is forward thinking in accepting the challenges of modern education, ever seeking the best for their youth. While involvement in this process is often fatiguing, frustrating and time-consuming, she urges each home economics teacher not to be afraid of "getting her feet wet" in this exciting facet of our total home economics education program.

## REPORTING FROM PONTIAC

When President Johnson signed into law the Vocational Education Act of 1965, a new emphasis was placed on wage-earning occupations in home economics. The School District of the City of Pontiac accepted the challenge and in February of 1965 initiated a food service program at Central High School. The program is rather unique in that it was initiated on a minimum budget and was organized in a home economics multi-purpose room which was not being used to capacity. Since the program was initiated, the home economics program has expanded approximately 35 percent and general classrooms are being used.

The events which led to the development of the food service program at Pontiac Central High School are included below because they may be of help to other communities.

In the spring of 1964, the Superintendent of the School District of the City of Pontiac raised pertinent questions about establishing a wage-earning program in the food service area.

With this kind of impetus, the Director of Vocational Education immediately sent to 172 area restaurant managers and owners a questionnaire asking for (1) an estimate of the number of job openings they would need for the year, and (2) other pertinent information. Although only 18 replies were received, the total number of job openings reported exceeded 215.

In the fall of 1964 the newly hired helping teacher in home economics and the Director of Vocational Education visited with two restaurant managers and observed three secondary school food service programs in Michigan.

### Development of Several Designs

By October, 1964, three designs for a possible food service program had been created and submitted to the assistant superintendent in charge of instruction, the school district superintendent, and the two high school principals. The program designs ranged from a limited two-hour class to a full five-hour-a-day program with a tearoom operation. The most extensive program, or the full five-hour-a-day program, was approved for Pontiac Central High School, where facilities were available and it seemed to fit the needs of the student body.

### Planning Equipment and Obtaining Curriculum Materials

In November, 1964, a tentative list of equipment needed was drawn up with help from the school food service director in charge of cafeterias, and from suggestions about facilities and equipment included in curriculum materials. Gladys Knight, extension specialist, Tourist and Resort Division, School of Hotel, Restaurant, and Institutional Management, Michigan State University, was most helpful in providing bibliographies and mimeographed materials.

Home economics representatives from the Division of Vocational Education, State of Michigan Department of Education, were contacted and made aware of the plans to establish a food service program. They were very interested and helpful.

### Final Decision about the Starting Date

At this point the helping teacher in home economics, the Director of Vocational Education, and the Principal of Central High School began to have doubts about whether the program could be initiated by the second semester of 1965. The Superintendent of the School District in Pontiac, eager to see the new program a reality, insisted on the second semester starting date.

### Purchasing of New Equipment

Work continued on the selection and purchase of new equipment. The director of the school food service and the equipment company representatives suggested the type and size of equipment. The $2,400 spent on equipment included a mixer, chef's table and counter, fryer and grill, as well as commercial china. A counter steamer was added in 1965-66. The amount of money available had been set aside for development of new programs in vocational education.

### Financial Policies Related to the Program

A revolving fund of $500 for the first semester was established. A bookkeeping student was to keep the books. Since it was an instructional program, the administration did not expect to "make a profit" or "to break even."

Produce and meat were to be purchased by telephone from a local home-owned grocery store, where quality items were carried and delivery service was possible. Canned goods and other institutional products were to be ordered from a Detroit firm which was already making deliveries to the school cafeteria.

### Organizing the Courses and Recruiting Students

Students were recruited over the PA system, by asking them to attend an informative meeting. If interested, they were to fill out an application, requiring their counselor's recommendation and parents' signature. In February, 1965, the building principal in charge of guidance and counseling and the helping teacher in home economics eliminated three of 35 applicants because of poor attendance, and a record of being disciplinary problems.

Students were asked to enter the program for a two-hour block of time, choosing food preparation or food service. A half unit of credit would be given for each hour of class.

Girls were required to buy two uniforms and maintain them. Boys' shirts were rented at 40¢ per week from a local laundry. The tearoom operation would absorb the cost of commercial aprons for cooks and waitresses.

### Employing a Qualified Teacher

With the starting date two months away, the selection of a teacher became the crucial factor in the success of the program. Consultants in the State of Michigan Department of Education, Division of Vocational Education and Michigan State University recommended Mary K. France, who was just completing her graduate program for the master's degree. She was employed in December, 1964. Her background included (1) five years of home economics teaching and (2) education and experience in institutional food service. For eight summers she had been responsible for food service in a summer camp. She had several courses in institutional management and two years of experience in food service management at Michigan State University. Pontiac was most fortunate to secure the services of Miss France, who was a well-qualified teacher of a food service educational program.

## Making Changes in Home Economics Room and Reorganizing Equipment

Amazingly few structural changes were needed to prepare the L-shaped, multi-purpose home economics room for the new food service program. Two large tote drawer storage cabinets were moved to an adjoining office to give additional floor space. Sewing machines were stored in the school district warehouse. A laundry sink and another cupboard were removed to provide space for the grill and French fryer unit. School district plumbers and electricians installed a hood over the grill, venting it through a nearby window. Small equipment not usable for quantity food preparation was packed and stored in the building basement. The unit kitchens were designated bake, salad, cook's and short-order areas. The local health inspector was contacted about sanitation regulations and about any instructional materials available for loan.

Other changes and additions were:

1. A portable folding screen separated the food preparation area from view of the diners in the service area.
2. Tables were exchanged with those in the teacher's lunch room in the school cafeteria so that smaller, square tables would provide seating space for 30 at one time.
3. A cash register was obtained from the Business Department.
4. A cabinet with tote drawers was set aside as locker space for school books. Aprons, issued weekly by a student in charge of uniforms, were hung in a closet.
5. A second cabinet was used for a food storage cupboard for canned foods.
6. The dressing room for boys consisted of the former "fitting room" used in clothing construction. The dressing room for the girls was an adjacent office for the Department.

## Other Decisions

Union regulations which might affect the program were discussed with the assistant principal in charge of personnel. Results of a faculty survey were considered in determining menu entrees and prices. Students who elected the food service program suggested names for the tearoom operation. The principal and food service instructor chose "The Wigwam," in keeping with the Indian theme which is used throughout the school.

*Donald McMillan, assistant principal, Francis W. Staley, principal, Wesley Maas, assistant principal and Bonnie Lafountain, secretary, have given administrative support, guidance, counseling, and help in scheduling of students for the program.*

**Relationships with the School Cafeteria Personnel**

Cafeteria personnel were kept in touch with many decisions so that loss of customers three days a week might not result in any misunderstandings or friction.

Since a home style dishwasher was the only available piece of equipment in the room, arrangements were made with the cafeteria to wash dishes from the "Wigwam" tearoom after closing hours at 1:10 p.m. Students moved the dishes to the cafeteria in tote trays on a large cart and stayed to run them through the dish machine and help complete clean up.

**Contributions of Other Departments**

Other school departments helped in many ways. Through the Art Department a picture of an Indian was designed and painted to complement room colors.

The printing instructor designed and printed the menu covers.

**Formation of a Food Service Curriculum Committee**

The assistance and help of many individuals had been sought throughout the planning stages. In May, 1965, a Curriculum Advisory Committee was formally organized. Representatives included a dietitian and a supervisor from a local hospital, the supervisor of Oakland Community College Food Services, a restaurant

owner and four school personnel. The Committee was most helpful in providing suggestions for the food service program.

## The First Two Occupational Food Service Courses

Two courses in the occupational food service program were first offered at Pontiac Central High School, February, 1965. They continued to be offered during 1965-66 and 1966-67.

### Enrollment and Scheduling

Students could enroll in (1) Food Preparation or (2) Food Serving. Each is one semester in length. A student may take either of these two courses. They may enroll in the same course more than once. This provides for a longer training period, if desired or needed, by students. It also provides flexibility.

Thirty-two boys and girls in the tenth to twelfth grades were enrolled in the first food service program. The enrollment and organization of the first two courses remained the same during 1965-66 and 1966-67, except that enrollments were staggered after the first year. The overlapping thus left "no holes where work had to stop for 10 minutes" because one shift was leaving while another was coming in.

The total number of hours in the teacher's day or in the food service program is six hours. Students who enrolled in the food service program come to the laboratory for a consecutive, two-hour block of time, if possible. A few are in the program for three hours. An example of scheduling is provided below. This is important so students can perform the variety of functions needed in operating the tearoom service.

| Titles of Courses and Hour | Number Enrolled |
|---|---|
| Food Preparation | |
| (1st hour) | 8–10 |
| (2nd hour) | 10–12 |
| Serving | |
| (3rd hour) | 12–15 |
| (4th hour) | 10–12 |
| (5th hour) | 8–10 |
| Serving and Food Preparation | |
| (6th hour) | 6–8 |

*Experience in scaling helps to assure uniform quality in food products.*

*Confidence assures the customer she is getting the correct change.*

*Success gives the student pride and confidence in his work.*

*An efficient waiter knows the importance of a neat table.*

*Proper supervision, encouragement, and satisfaction are important in the food service program.*

*Experience in the use of institutional equipment is an important part of the food service program.*

### Organization of the Food Service Courses

Students in the food preparation course work at five different stations on a rotating basis: (1) range; (2) bake; (3) pantry; (4) vegetable preparation; and (5) grill and broiler.

Students in the food serving course assume the various responsibilities in two sections of the laboratory and tearoom facility: "front of the house" and "back of the house." "Front of the house" includes the jobs of (1) host and hostess; (2) cashier; (3) waitress or waiter; and (4) bus boy or girl. The "back of the house" includes positions as: (1) portion control; (2) taking orders; (3) salads and desserts; (4) breads and salad dressings; (5) short orders—grill and broiler; and (6) pots and pans.

*Menu Planning, Buying and Receiving.* The instructor does the menu planning and buying. The students receive and store commodities.

An attractive menu format, stating the course objectives and including a la carte items, was printed in the school print shop. A flyer which includes three table d'hote items is inserted daily.

*Serving.* Luncheon is served three days a week (Wednesday, Thursday and Friday) to faculty, school personnel and other guests. Students in the program, and other students on an issued-pass basis, also are served in the tearoom.

*Other Class Activities.* On Monday and Tuesday, time is devoted to evaluation, lecture, discussion and needed miscellaneous housekeeping duties.

## The Third Course: the Cooperative Program

The first student on the cooperative program was enrolled in the winter, 1966. Since then four students have been placed in the Cooperative program at a hospital, Oakland Community College food service, and a bakery. Anticipated stations include nursing homes and local restaurants.

The Food Service Coordinator is Carol Irish, helping teacher of home economics, Pontiac Public Schools.

### Reactions

*Reaction of Faculty and Other Guests.* Responses of the faculty indicate that they are amazed at the actual food production possible in this type of situation. They wonder how it is done with inexperienced students who are in the process of learning and the limited facilities.

The quality and variety of food and the spread of services have increased.

*Reaction of Students.* In general, students have responded with increased confidence in themselves in: (1) meeting adults; (2) meeting many different situations; (3) ability to see jobs to do; and (4) making needed adjustments in their responsibilities in case of absence of a class member. The effects which absences and loafing have on the total operation are obvious to them.

**Follow-up**

Two former students are enrolled in food service programs at Oakland Community College and at Ferris Institute.

A regular follow-up study has been made each fall. However, there are certain difficulties and inaccuracies occurring because of the nature of the vocational education form which is provided for follow-up in reimbursed vocational programs.

Some improvements in the form are being made.

**Plans for the Future**

There are a number of uncertainties which make it difficult to plan for the future. However, new facilities have been planned to replace Central High School and to build a possible third school on the east side. There are plans for a vocational area school which will be put before the voters this June.

There has been some discussion of how the food service program at Pontiac Central might be coordinated with the Oakland Community College food service program.

The following indicate some other plans:

1. Further development of the Cooperative program
2. Development of some methods for recruiting students
3. Development of experiences for "repeaters" in the same course. These repeaters are students who choose to stay one to one and one-half years on the food preparation or food serving program before going into the Cooperative program.
4. The possibility of releasing the helping teacher in home economics from her classroom duties in order to serve as a coordinator of the food service program and/or other programs which may develop. The coordination of the present nurse's-aide program then may become the responsibility of the helping teacher in home economics.

## REPORTING FROM WAYNE

The Wayne Community School District has been fortunate to have the services of a Citizens' Advisory Committee on Vocational Education for more than two years. The Committee has been very active and helpful in determining the vocational needs of the district.

Employment opportunities and basic needs for home economics-related occupational programs are currently being determined from national, state and surrounding local informational surveys. The Wayne Community School District has not made any local surveys regarding home economics occupational needs.

Local businessmen have been contacted informally and they have expressed an interest in a food services program. The Wayne Community School District is in process of organizing its first occupational committee in the area of food services. This committee will assist teachers and administrators in developing a curriculum for the area of occupational food services.

*Waitressing in the faculty tea room provides a variety of needed experiences in hospitality and serving the public.*

## Preparation for Food Services Occupations

The occupational program for food services is a specialized program offered by the Home Economics Department. Students participating in the wage-earning program are selected on the basis of interest, ability and attitude. The curriculum, as currently projected, will be a two-phase program.

The orientation course is offered at Wayne Memorial and John Glenn High Schools. The occupational foods course (second course) is offered only at Wayne Memorial. If students at Glenn wish to continue in the "two-hour phases," they are provided transportation to the class at WMHS.

Margaret Langdon, Wayne Memorial, assumes responsibility for direction of the program. She is assisted by Wanda Nelson and Carol Gaffney. Miss Gaffney teaches at John Glenn.

### First Phase: Orientation to Food Service Occupations, 1965-66

This course was first offered in 1965-66. It begins at the tenth grade level and will be open to all students, (tenth, eleventh and twelfth grades) desiring to prepare for employment in the food service field. The one-hour course includes: introduction to the food service industry; personal development; health practices; grooming; sanitation in food preparation; care and use of equipment; preparation of food on a small scale (salad work, baking, meat and vegetable cookery, soups and sandwiches); and proper service to the customer.

### Second Phase: Preparation for Food Service Occupations 1966-67

This course was first offered in the fall of 1966-67. It will begin at the eleventh grade level and will be offered to the students who have completed the orientation course. The course will be two hours in length, providing the boys and girls an opportunity to learn and practice methods and processes of the food service industry. Emphasis for approximately the first two months will be on sanitation, good health practices, care and use of equipment, preparing food on a quantity basis, serving the customer and menu planning. The occupational areas stressed are: cook's helper; pantry (salads); baking; fry cook; counterboy or girl; waiter or waitress; bus boy or girl; cashier and hostess.

*Students in the food service program maintain an attractive appearance and keep work areas neat and orderly.*

The following is a description of the food service course at Wayne Memorial High School as reported by Joyce Haglethorn, ANP Staff Writer.

They subscribe solidly to the adage that the proof is in the pudding over at Wayne Memorial High these days. And, if you like, they can do it with real pudding!

The pudding and lots of other good eating are the products of a somewhat unique education process—training students for employment in food services occupations and, in a sense, even the operation of a "restaurant" two days a week.

The "restaurant" is where the proof of the skills comes out. Tuesdays and Thursdays, the teachers of WMHS may have lunch at a special room where a special menu is prepared and served—from soup to dessert—by students in the program.

Officially, the entire program operates under the rather "unrestaurant" sounding title of Food Service Occupations Program.

Students in junior and senior years who indicate a desire for possible employment in food service occupations—such as fry cook, salad maker, waiter or waitress, baker, etc.—are eligible to participate.

The program received most of its impetus and gets most of its direction from Margaret Langdon, instructor. But its concept was heartily endorsed by George Bell, WMHS principal, and Jack Drew, coordinator of vocational education and practical arts, as well as a Citizens Advisory Committee for Vocational Education.

This program started last September and, according to Drew, a lot of the interest as well as its success can also be credited to several local restaurant owners and managers who act in advisory capacities when needed.

The program is in two phases. The first is orientation to food services occupations and is a one-hour offering to acquaint and probe student interest. If the interest sustains, the student may enroll in the second phase, a two-hour offering, which gets right down to more detailed learning and practice.

Although the variety of choices on the menu is relatively limited on any given day, over a period of time it exposes the apprenticing cooks, bakers and waitresses to considerable experience.

Assisting Miss Langdon are Mrs. Wanda Nelson and Miss Carol Gaffney. Miss Gaffney teaches at John Glenn where only the orientation program is now offered. However, if Glenn students wish to continue into the two-hour phases, they are provided transportation to the class at WMHS.

Approximately 75 young people are now involved in the various phases of the training—many, or most, of whom expect to use their skills on an actual job basis rather than pursuing college, Drew notes. He is joined by Dr. Orval Conner, assistant superintendent, in an enthusiastic belief that the program is doing a lot of good.

Principal Bell feels major recognition for success of the program is due to its teachers and the students themselves.

"We often recognize excellence in the athletic or academic field, but sometimes we overlook the kid who is doing just as good a job in excelling at a task that will better prepare himself for the working world," Bell says, adding: "It is a real tribute to our teachers and our system that they do not overlook these needs and accomplishments. They are making real contributions."

Furthermore, he notes, he can produce the pudding to prove it!

## PART III

# Reports from Communities in Initial Stages of Planning, Decision-Making and Implementation

## REPORTING FROM ALPENA

At the workshop at Michigan State University, summer 1965, Muriel Henry, home economics teacher at Alpena High School, explored feasible procedures for establishment of home economics-related occupational programs in Alpena. She took into consideration the interests and concerns of her local school administrators. She outlined tentative procedures which she believed would be needed prior to and following the availability of the findings from the vocational-technical area study.

This Alpena report high-lights: (1) early plans made at the workshop, summer, 1965; (2) progress made in implementing and/or adjusting the workshop plans, 1965-66; (3) some of the findings and recommendations reported in the vocational-technical area study and (4) some next steps.

### Early Plans Made at the Workshop, Summer, 1965

Since emphasis has been placed on the importance of securing a high school diploma, many of our Alpena students are at a loss, because our high school curriculum fails to offer a sufficient number of subjects geared to certain groups (for example, the slow learner). Our school administrators and guidance director have requested a vocational home economics program in wage-earning. Pre-occupational and terminal occupational courses are being planned for the senior high school level.

In the near future at the Community College level we hope to add vocational home economics courses in wage-earning, which require greater maturity and skill than those planned for or offered at the secondary level.

Starting in September, 1965, a team from Michigan State University was to conduct a survey of employment needs in Alpena, Alcona, Oscoda, Montmorency and the eastern half of Presque Isle counties, the results of which were to be available in February, 1966. Alpena High School had been designated as an area vocational high school. The findings from the study were to serve as a basis for decisions about the total occupational program to be developed in the Alpena area.

The home economics teachers, with others, were to study the report of the area survey and determine cooperatively the implications for home economics.

Three types of procedures seemed appropriate for use prior to the availability of the findings from the vocational-technical area study. Each is briefly described below.

1. Materials which will make pupils aware of wage-earning opportunities in occupations related to home economics will be collected and made available as a part of the regular home economics work.

2. A leaflet designed by home economics pupils and listing the recognized occupations in home economics will be prepared and circulated in the Alpena area. The list of occupations will be taken from the *Bulletin of the National Association of Secondary School Principals*, December 1964. Area citizens will be made aware of the groups we are, or will be, trying to serve: Eleventh and twelfth graders whose formal education will terminate after high school graduation; drop-outs and persons with special needs; adults and community college students.

3. The home economics teachers will work with the local school administrators in organizing a local advisory committee to assist in planning and developing the home economics occupational program. Decisions about advisory committees are made at the administrative level. Discussions will be held with administrators about the plan and the need for community assistance in program development in the area of home economics occupational preparation, the functions of an advisory group and possible membership.

Following the availability of the report of the Vocational Technical Area Study, the findings will need to be studied and plans will need to be made to work out appropriate programs for voca-

tional home economics in wage-earning. The home economics teacher will work with the local director of vocational education regarding a vocational home economics program in wage-earning at Alpena Community College. Plans and requests for approval of vocational home economics occupational courses for Alpena will be discussed with home economics consultants, State Department of Education, Vocational Education Division, prior to submitting them for approval. This will be done to check the adequacy of the tentative plans in relation to accepted criteria and standards for occupational courses or programs.

## Implementing and Adjusting Workshop Plans, 1965-66

Progress was made in 1965-66 in: (1) interpretation of home economics in wage-earning preparation; (2) establishment of evidence of need (employment opportunities); and (3) planning and offering courses or parts of courses.

### Interpreting the Potential Contribution of Home Economics in Occupational Preparation

Plans were explained to faculty during a faculty meeting devoted to occupational education, and four home economics teachers spent much time talking with local businessmen. Plans were also explained to AAUW members and to high school classes from seventh through eleventh grades.

### Establishing Evidence of Need for Occupational Preparation in Home Economics

Clothing stores were contacted. They were not interested in alterationists, as their work is done in private homes. Motel owners preferred to train their own personnel and preferred mature, married women, except one owner who was a Board of Education member. Bakers preferred to train their own and, in most cases, the business was a family proposition. Dry cleaners preferred training their own help. With the exception of a few who served liquor, employers were interested in waitress training.

Until the results of the vocational-technical area survey, are received, it appears that the program will be limited to waitress training, and short order cook training (Food Service).

Our retail sales classes do an excellent job of preparing students for clerking. We plan to do some team teaching on yardage, etc., with the retail sales teacher.

### Planning and Offering Home Economics Occupational Courses

A unit on waitress training was included in Home Economics III, during the fall semester, 1965. It was five weeks in length. No specific courses in occupational orientation or occupational preparation related to home economics have been planned or offered for any group at this time. Prior to our survey we felt the need was greater than the findings indicated.

## Findings and Recommendations

The following findings and recommendations are excerpts from the May 1966 report, "Improving Vocational-Technical Education in the Thunder Bay Area." They have been included below, because they appear to have some direct implications for educational planning in Alpena. The excerpts focus on: (1) attitudes of various groups toward education for employment; (2) employment conditions and training needs in occupations related to home economics; (3) preparation for employment in occupations related to home economics; and (4) general recommendations for vocational education.

### Attitudes of Various Groups

The report shows that (1) there were favorable attitudes of various groups toward education for employment and (2) home economics teachers in the area felt inadequately prepared for responsibilities in establishment of occupational programs related to home economics. The following are excerpts:

> High school administrators were most cooperative in this study and evidenced not only great concern for education for employment, but a recognition that cooperative shared efforts would be necessary and desirable, if all youth and adults are to have equal opportunity for their economic development.
>
> School administrators indicated strong interest in the Cooperative Work Study plan for providing vocational education on an area basis. Eleventh and twelfth year students would gain vocational education by dividing the school day equally between school subjects and training on-the-job. The school would arrange for training with selected employers and would supervise the instruction through its coordinators.
>
> Business, industrial and agricultural leaders in the area evidenced much sincere concern for providing vocational education. They appear, by past efforts, to be more than willing to advise on planning the needed educational programs.
>
> The home economics teachers in the Thunder Bay Area are almost evenly divided in belief as to the purpose of home economics instruction at the high school level. In the smaller schools, teachers subscribe to the dual purpose of prepara-

tion for home and family living and wage-earning as primary, wheras in the larger schools where the dual purpose is more feasible of implementation the teachers support the position that home and family living should be the primary purpose.

Several of the teachers expressed willingness to include the wage-earning emphasis as a part of the home economics program at the high school level. However, the teachers did not perceive themselves as being prepared to teach in such a program and expressed the need for help and guidance in planning wage-earning programs.

## Employment Conditions and Training Needs

The report, "Improving Vocational-Technical Education in the Thunder Bay Area" indicated some limitations with regard to employment opportunities and training needs in occupations related to home economics. The following excerpts provide some specific directions:

Entry level jobs in occupations requiring home economics-related preparation are limited to Alpena, for the most part, and the demand is not great. There are some opportunities for cooks, bakers, waitresses, nurse-aides, child care aides, and housekeeping service workers.

Employers are not in concert with regard to the need for training programs. For waitressing and motel housekeeping aides, some employers want to do their own training, whereas others believe training programs sponsored by the schools would be very helpful.

Nursing personnel, especially registered nurses, are in short supply. Alpena General Hospital has a source of supply for practical nurses, due to their participation in the practical nurse program out of Traverse City. Nurse's-aide training is also done by the Alpena General Hospital when there is need of personnel at that level. However, training at the hospital takes the time and attention of a highly trained nurse who is needed elsewhere. Since the training of nurse's-aides can be done effectively in a fairly short period of time by another agency, it seems that other possibilities for nurse's-aide training should be explored.

## Preparation for Employment

The following excerpts from the report indicate the role and responsibility of Alpena as to home economics-related occupational preparation:

Occupational training for specific occupations is not feasible in terms of either numbers of potential students or facilities available in any of the high schools except Alpena and Rogers City. Therefore, the smaller high schools should not attempt job training programs, but should confine their activities to prevocational class experiences.

Alpena High School should provide job training classes for certain food service occupations, child care aides, housekeeper aides, nurse's-aides, and others, as interests of students and placement opportunities show a need for such programs. The above list of occupations is neither definitive nor exhaustive; neither would such specific titles require training programs in any foreseeable sequence

nor frequency pattern. Additional studies will be needed to ascertain occupations for which to provide training.

The dropout group must have more appropriate educational offerings available while still in high school.

Alpena High School should employ another home economics teacher, if enrollment remains the same or increases. Some home economics teaching-learning could be done in non-laboratory facilities, if there is a question of adequate facilities for use of three teachers. The new teacher-position could provide for strength in home and family living at the senior level and the occupational training program.

Homemaking teachers estimated that between 5 and 50 per cent of the mothers of their students were employed. Of eleventh grade students 29.6 per cent reported their mothers were working. The occupations in which the mothers were employed were mainly professional, clerical sales, and factory work of various kinds. Some related occupational training might help working women advance in their jobs. On the other hand, many of the working women, as well as those in full time homemaking, might be interested in employment preparation or home management training. There ought to be some encouragement on the part of adults in the area to continue learning through offering of a variety of adult classes in homemaking related fields.

There is no home economics offered at the community college and no plans for such offerings in the future.

Alpena Community College is planning the development of an associate degree nursing program. In the light of shortages in the nursing field, such a program would appear, on the surface, to be highly desirable.

## General Recommendations

The following are some of the major recommendations for vocational education made in the report:

1. A comprehensive program of vocational education should be developed at Alpena High School. Alpena High School should be provided with a supervisor of Vocational Education, maintaining liaison with the Director of Vocational-Technical Education at the Community College and assisting local districts in developing and implementing shared-time arrangements with Alpena High School.

2. A Thunder Bay Area Vocational-Technical Institute should be created serving all districts now associated with the Intermediate School District. It should show in operation a total commitment to vocational-technical education by providing for: collegiate and non-collegiate programs; all occupational areas; both full-time and part-time students; courses and curricula of varying length from short courses and clinics to two-year curricula.

It should provide shared time arrangements with local high schools which desire it and have an open door policy, but admit students to a specific program (curriculum) based on their aptitude and capacity rather than admitting students to any curricula without reservation.

A director of the vocational-technical institute should be responsible for developing, implementing and supervising a comprehensive program. He and his staff would also serve as vocational consultants for high schools within the Intermediate School District. The Institute should make extensive use of advisory committees for each occupational curricula. It should have a facility designed for approximately 250-300 full-time student stations. All vocational-technical curricula should be housed in this facility.

## Some Future Steps

Since Alpena is designated as an area vocational school, there are many challenges ahead for working cooperatively with other schools in making occupational education related to home economics available to those who are interested and in need.

An associate degree nursing program at the Alpena Community College has been approved by the Board of Education and the State Board of Health. However, difficulty has resulted in obtaining a director for this program. Its realization is two to three years away.

Plans for the future development of home economics-related occupational preparation in Alpena are being discussed or explored. The new and expanded high school facility and new programs in vocational education no doubt will affect decisions about needed courses or programs in home economics which can, or should be, offered in the near future.

The need for employment of an additional staff member whose chief responsibility would be home economics-related occupational education is recognized. The team from Alpena indicated in May, 1967, that the new teacher position should be in wage-earning related to home economics and the present teachers would be responsible for the regular home economics courses focused on homemaking and family living.

## REPORTING FROM GAYLORD

In 1962, the Gaylord Community School administration initiated a study of the employment opportunities in the fields of business and clerical, agriculture, trade and industry and home economics. The major purpose of this study was to determine or assess the needs for additional facilities in the school for occupational preparation in the several fields of vocational education.

Business leaders were interviewed by key members of the community who were interested in adequate educational programs for all the students.

The results of the study indicated strong support for additional training facilities. These were interpreted to the community and, as a result of the survey, the community approved the bond issue to construct a vocational wing and a physical education facility.

Construction of the vocational wing was completed in 1964, and new programs for occupational training were launched in: automechanics, office machines, distributive education, agriculture, construction and machines and metal.

### Progress Made in Home Economics Occupational Programs

No occupational programs were launched in home economics. From the survey there was evidence of employment opportunities in home economics-related occupations. Results of an additional survey also indicated parent and citizen support for home economics courses for girls who are in various curricular programs including college preparatory, business and general.

Probably the major causes of this postponement of home economics-related occupational programs were: (1) mounting costs of education in the vocational areas in the school; and (2) the hesitancy of the home economics teacher to add an occupational program to an already full schedule of courses in homemaking and family life.

### Plans for the Future

Plans are now being considered for some action in providing occupational preparation in home economics on a limited or exploratory basis without additional financial support. The current program, geared to education for homemaking and family living, could include a unit of instruction on "Occupational Orientation." This could become a part of Homemaking II at the tenth grade level.

If additional staff could be provided at some future date, needed occupational courses could be offered for those groups with the greatest need, or greatest potential, for employment. The findings and recommendations made in the report of the vocational-technical area study would be one source upon which decisions could be made. The groups might be out-of-school youth, adults or high school students.

## REPORTING FROM MENOMINEE

The Menominee Area Public Schools failed to implement any wage-earning programs during the developmental project. Two sets of related circumstances worked against the early realization of the desired degree of progress.

First, the beginning of the project, spring 1965, coincided with the date on which the district initiated an ambitious construction program. Planning for buildings which would represent a capital outlay greater than four times the total annual budget consumed most of the energy and interest which the community had to spend on schools. Nearly all planning for wage-earning home economics activities was based on the expectation of a new secondary building two years hence.

The second set has to do with one of most fundamental problems in vocational education: that of determining the scope of the occupation, or family of occupations, which should be included within a particular course or program. This problem is especially troublesome in Menominee, because the secondary enrollment is small (1,000 in grades 9 through 12) and employment in wage-earning home economics type occupations is sharply seasonal.

### Discussion

A broadly representative assortment of dedicated and informed community leaders met six times in a few weeks to write the home economics educational specifications from which Louis C. Kingscott has derived the design for the new high school building. These people had two recent developments with significance for wage-earning home economics to which to refer in their planning. One was a comprehensive study of the opinions of employers in the community concerning shortages of skilled workers. The other was a very successful, short, in-service, upgrading course for waitresses conducted by Northern Michigan University and Menominee Area Public Schools in the old high school building.

## The Chamber of Commerce Study

In the fall of 1964 the local Chamber of Commerce activated a vocational education study committee. The committee obtained dozens of days of professional consultation from the staff of Northern Michigan University. These consultants and committee members spent hundreds of hours interviewing employers in this community to identify those occupations in which vocational education needs existed. Of those which were mentioned in the Chamber's report, the following might be considered to be related to wage-earning home economics: waitresses, home appliance repairmen, receptionists, custodians, medical technicians, nurse's aides, practical nurses, registered nurses and medical orderlies.

A few occupations were conspicuous by their omission. The fact that cooks, chefs, seamstresses, and garment cutters were not mentioned, calls attention to a few principles which are probably worth mentioning in this report. Cooks and chefs play a crucial role in the economy of this community, especially during the tourist season, but the total number of them is small. Even if geographic mobility, wage-competition, and other relevant factors should be momentarily ignored for purposes of simplifying the problem, the lack of a sufficient *number* of openings for chefs to absorb the graduates of a program of practical size rules out such a program in spite of the potentially high value of individual graduates. (Geographic mobility is a factor from which chambers of commerce almost invariably hide.)

Fairly large numbers of seamstresses and garment cutters are employed in this community, but there is still a surplus; those who are employed have a union shop, and their wages are not yet very attractive. The reasons for not undertaking vocational instruction for these occupations are different than those for not undertaking chef and cook training, but the result is the same.

## The Waitress Training Course

An in-service short course for waitresses was developed in the fall of 1964, primarily by Edward Sell, Northern Michigan University, and Alex Nelson, Menominee Public Schools. They based it on the experience which they had gained in the course of helping conduct the Chamber of Commerce study.

Fifty waitresses were recruited as students by selling the course of study (which was really just a good indoctrination and refresher lecture series) to most of the employers in the community. Most

students were reimbursed by their employers for their $5.00 enrollment fee.

Fees paid about two-thirds of the direct cost of instruction and supplies. Other expenses of the course remained buried in the normal operating expenses of Northern Michigan University and Menominee Public Schools.

At the time of enrollment, each student chose between the afternoon and evening sections. Six sessions of two and one-half hours each were held on successive Thursday afternoons and Thursday evenings.

A management instructor from Northern Michigan University taught the first session. A graduate dietitian and an experienced waitress collaborated in teaching the remaining sessions.

### The Clinical Sessions

One program which was discussed at the clinical sessions in phase four of the project seemed to be well suited to adaption by small schools like Menominee.

The in-house orientation course for a family of occupations (food services in the example from Wayne) followed by a small group of related cooperative courses, seems to be the only plan which will get results at a price that our budgets can afford. Some of the usual drawbacks in cooperative plans are not very serious in this community and some of their advantages are realized to the fullest extent here.

### Conclusions

The Menominee Area Public Schools community is aware of a need for home economics occupational training. Adapting some of the experience gained by other schools to the courses of the Home Economics Occupational Training project will probably be the way in which this need will be met first.

## REPORTING FROM WYANDOTTE

For a number of years the home economics teachers at Theodore Roosevelt High School have wondered if there were employment opportunities for youth and adults in occupations related to home economics and what would constitute a "successful" program for pre-employment preparation from the viewpoint of the students and faculty, the parents, citizen and employer groups.

## The First Approach

In the summer of 1965, two of the home economics teachers from the Theodore Roosevelt High School attended the Home Economics Occupational Training Workshop at Michigan State University. One of their goals was to prepare some materials, questionnaires, or checklists which would be used in studying employment opportunities and need for training programs related to home economics in the Wyandotte area.

Some progress was made at the workshop, but the major part of the work was completed following the workshop. Considerable frustration was experienced in the preparation of the kind of questionnaire or checklist which would offer some reasonable promise of reliable and valid results. There was difficulty in identifying and classifying the occupations, so potential employer groups could respond intelligently about present employment opportunities or anticipated future needs.

Decisions were tentatively made to organize established occupations into the following clusters: clothing services; food services; family services, child care, care of the elderly and care of the sick services; housing, home furnishings and household equipment services. The Michigan Employment Security Commission office was contacted to secure data about employment opportunities, but no data were available which appeared to be useful for the Wyandotte area.

The Chamber of Commerce was contacted for lists of business, industrial, health or social service establishments. No lists were available.

The *Yellow Pages* and city directories were studied and a file of establishments was compiled and classified using the clusters listed above. Questionnaires and checklists were prepared.

The MESC office was again contacted to secure reactions to the proposed instruments for making local studies of employment opportunities. However, there was a long delay and the materials were reported "mislaid." Toward the spring, 1966, this problem of studying employment opportunities was "postponed" for a later time.

## The Second Approach

In the spring of 1966, it appeared that a promising approach might be to offer a home economics occupational orientation course. This would not require employment data. Such a course

would provide time for the teachers and the students to study and learn together about the employment opportunities, through speakers, field trips, interviews and informal studies, including analysis of "employment ads."

The home economics teachers felt there was a need for the orientation course: (1) the girls are unrealistic about their future plans; (2) there is a lack of understanding about occupational opportunities in home economics; (3) the course would do something that "no other class does" in the curriculum at the high school.

The course would emphasize the world of work, including multiple roles of women; job opportunities in home economics; employers expectations and legal requirements; and need for genuine job experience. It would provide certain of the common elements in making young people "more employable," such as manners and personality; grooming; ethics; effective interviews.

The course would be scheduled for the last two periods of the day (7th and 8th periods) which would help in making field trips possible. The enrollment would be limited to 20; the credit would be 5 academic or activity credits. It would be offered for 11A students who had 60 credits. An advisory committee would be appointed to be chosen from administration, faculty and business people.

The criteria for enrollment would be: agreement to go on field trips; parental support; sincere interest in the course. An application form would be developed. Interest and average ability would be possible criteria.

Plans for the proposed course would need to be submitted to administrators and then to counselors for final decision before it could be offered. Such a brief was prepared.

In the spring, 1966, at a meeting with school administrators the need for the course, the goals, content and organization were discussed. However, there was agreement that the course could not be offered in 1966-67 because: (1) all home economics teachers had full loads; and (2) there was not one room in the building which was available or "free" any hour of the day.

There was some discussion of offering the course on a trial basis only, for activity credit, and offering it after school hours. The decision to offer the course on this basis was not regarded as feasible or desirable.

## Conclusions and Possible Next Steps

We feel that we have some basis upon which to build some pre-employment education related to home economics. Several factors seem important for future steps: (1) some released time needs to be provided for someone to follow-through and (2) some adjustments need to be made to free both time and space for offering any new home economics course.

The home economics teachers are at present helping to outline the distributive education course.

There was some discussion of making certain adaptations in the present homemaking offerings. For example in one or two semesters of the advanced courses in clothing, opportunities appear to exist. At present, there are four semesters of electives in clothing (Clothing I, II, III, and IV). These classes meet one to two periods a day.

One or two advanced courses in foods might be slanted toward pre-employment education. At present, there are three semesters of foods offered (Foods I, II, and III). These classes meet two periods a day.

In the winter, 1966, there was some discussion of the possibility of providing some pre-employment courses in foods, clothing and home-nursing, with the possibility of a semester of cooperative training.

Certainly there are some genuine alternatives, but agreement has not been reached at this time.

## PART IV

# What Has Been Learned — Looking Ahead

If you are thinking about the new dimension of wage-earning or occupational preparation in your home economics program you may find one or more of the following suggestions interesting, challenging or otherwise useful. The ideas expressed are based on what was learned through the experiences of the ten communities and through discussions with the Advisory Committee and the evaluation panels.

If you are thinking about the possibility of an occupational program in home economics, then it would be well to become as informed as possible about the establishment of such programs. Visit programs in operation; talk with people who have had experience; and read articles or reports. All are very useful.

A good deal of hard work is involved in the various steps in occupational programs. Be flexible and creative, but also be prepared to take some risks! It is entirely possible that after a great deal of work has been completed by many people, that the decision may be not to establish a course or program, or to delay or postpone it.

### Need for Administrative Support

Potential programs in occupational preparation have greater chances for successful launching and implementation if school administrators give adequate support from the beginning. While there is evidence that school administrators believe that the major role of home economics is education for homemaking and family life, many see that home economics also has a responsibility and an important contribution to make in wage-earning preparation.

The following statements made by a school administrator and coordinator of vocational education illustrate this point:

> "Home economics and family life education provide basic education for all people. This emphasis or contribution is the first challenge."

"Within vocational education, home economics needs to meet the challenge of expanding the occupational program. This may not be easy."

A teacher in an effective food service program emphasized the importance of genuine support of administrators. She wrote:

"Administrators must have a real understanding of the program and its requirements. They must be willing to provide enough funds to operate the program efficiently and the teacher may need to be freed from other responsibilities to organize the program successfully."

**Allow Adequate Time**

The teams from the participating communities agreed that "timing" and the need for adequate time for planning were areas in which major lessons had been learned. They questioned crash programs in which plans are hastily made and implemented. They strongly supported the need for some released time and a flexible schedule for the person(s) responsible for program development.

Specific suggestions which were offered were:

1. "Allow one and one half years for the planning phase. Start planning in the spring, preferably March; don't wait until September. Spend two weeks in a local summer workshop to plan the course or courses. Continue planning and working throughout the next year."

2. "Be sure to allow time to prepare curriculum materials. Teachers lack time to write curriculum materials during the school year. A summer workshop may be the best time."

3. "Provide released time or a flexible time schedule for someone directly involved in getting the program established and underway."

4. "Initiate the program experimentally the first year in which it is offered. Launch the program after two years of planning and getting ready. The first year, launch it as an experimental and try-out period. Make changes and/or adjustments; see how it is going."

**Build Close Cooperation Among All Vocational Services**

The importance of close cooperation within vocational education and of breaking down rigid organizational patterns in vocational education were repeatedly mentioned for effective future planning and program development. The team approach within vocational education had high acceptance and was regarded as a move in the right direction.

Members of the advisory committee to the project and the evaluation panels have been quick to show reasons why occupations should not be regarded as home-economics related and that programs should not be so identified. It was generally conceded that (1) occupations are difficult or impossible to classify according to traditional vocational services as agricultural education, distributive education, home economics education, or trade and industrial education and that (2) occupational programs would be more effective if they were characterized by across the board planning and teaching.

The breaking down of the rigid organizational patterns in vocational education is a challenge for the future! Members of the evaluation panels re-emphasized the importance of including counselors in all the phases of program development in home economics. Informally chatting with the counselor(s) was regarded as an effective method of communication.

**Have Several Kinds of Advisory Committees**

Teams from the participating communities and vocational specialists recognized the need for several kinds of advisory groups who would have quite different functions. Need was expressed for an advisory or citizens group for vocational education; an advisory group for occupational programs in home economics and a special advisory group for occupational preparation in the specific clusters in which programs were being established.

Some specific suggestions included:

1. "Don't use advisory committees to get what *you* want! Use it on a genuine cooperative basis in which exchange of ideas are important."
2. "The Board of Education will be more convinced of the need for educational and financial support, if a strong advisory group is backing the program."
3. "You need a committee for each cluster of occupations."

4. "Do not have regularly scheduled meetings. You need a meeting when something really needs to be accomplished."

**Build A New Type Of Team Approach Within The School**

Close cooperation within vocational education is not enough! There was consensus that a genuine school team approach would be a productive, effective and rewarding method of working in establishment and evaluation of an occupational program. While representation on the teams might vary, theoretically there should be as broad a representation as feasible, including administrators, counselors, academic faculty and all vocational services.

Fears were expressed, especially by members of the evaluation panels, that failure to include on the school team academic faculty as well as representatives from all vocational services might disastrously result in a closed, isolated, ineffective or frustrated group. There were also fears that home economics might "go-it-alone" and that it might not involve the other vocational services and academic faculty to the degree that it should. They realized that the present organizational patterns might encourage the splintered, segmental or disciplinary approach. However, they believed that effort should be made in home economics to break through the barriers and to innovate new and more effective approaches.

Some felt that the home economics teacher or supervisor might need to be the impetus to get such a team appointed, organized and underway. Others felt that the director of vocational education or the coordinator would be in a more favorable position to do this. Such a group was referred to as an In-House Advisory Committee.

**Be Imaginative In Providing For Space, Facilities and Equipment**

With an imaginative teacher and some additional funds, regular homemaking laboratories or facilities can be effectively adapted for use in many types of beginning occupational courses. Facilities and equipment for advanced courses usually are provided in a special school, or in an area vocational school, where students are bussed to the central school especially equipped for specific curricula. Cooperative occupational programs provide realistic on-the-job experiences and reduce the necessity or demand for expensive equipment at the secondary level.

Some vocational funds for the purchase of equipment may be available for local communities. However, local administrators

should contact the Division of Vocational Education, State of Michigan Department of Education, for information about the availability of these funds at any particular time.

Space, if not otherwise possible, may be made available for occupational courses through adjustments or revision of regular home economics offerings. This can be done with the possibility of enrichment which "livens up a program!"

A "bang-up summer occupational program" is another alternative which might be used to provide space in an over-crowded school.

### Consider Load of the Occupational Teacher

One member of the evaluation panel reported that a full load for an occupational teacher consists of one class in the morning and one class in the afternoon, working with 40 students. Each class would meet usually for 120 to 180 minutes. The rest of the day is considered released time for performing the other functions needed in carrying on an occupational program.

An effective home economics occupational teacher pondered the question about her load. She wrote:

> Administrators must be able to justify the fact that a teacher on such a program may be able to carry only 30 to 45 students successfully, whereas student loads for other classroom teachers are much heavier.
>
> As one sees students not only gaining certain saleable skills, but increasing their feeling of self-worth and improving their ability to get along with people, the demands of the program seem increasingly worth the cost.

### Need To Be Flexible and Imaginative In Staffing Programs

The teams from the participating communities emphasized the need for an effective teacher of an occupational course or program. Some simply put it this way: "You have to have the right teacher." Others put it in another way: "The key problem is to get people to train the students."

Certification of teachers for occupational programs frequently presents a problem. Standards and requirements for initial and continuing certification of occupational teachers as defined by the State Department of Education, Division of Vocational Education must be met; however, these are generally reasonable and flexible.

There are several alternatives in staffing home economics-related occupational courses: (1) a home economics teacher with occupational preparation and experience in the special occupational cluster involved; (2) an occupational specialist with training and

work experience in the occupational cluster; (3) team teaching or a teacher-coordinator of a course or program, with special parts or units taught by occupational specialists who are knowledgeable and experienced in the cluster.

Home economics teachers are generally not qualified without additional preparation and adequate work experience to teach occupational courses. However, there are usually, within the geographical area, home economists who majored in their college programs either at the undergraduate or graduate programs in such fields as: institutional administration, dietetics, child development, social service and family life, retailing, textiles, clothing, housing, home furnishings, and equipment. With encouragement and some in-service occupational preparation, many of these women would be enthusiastic and capable teachers.

Teachers are being encouraged to attend special summer workshops on wage-earning programs, and to enroll in courses offering opportunities for work experiences in specific areas.

The evaluation panels stressed the need for colleges and universities to step up their programs to provide college credit for work experiences in various clusters related to home economics at both the pre-service and in-service levels. The suggestion was made that work experiences in two areas be built into the curriculum for home economics teachers. Need was also expressed for submitting research proposals to finance internships in vocational education to prepare leaders for "across the board competence."

In several of the programs, home economics teachers are gradually working into responsibilities of the coordinator. The following suggestions were made:

> "Start with the coordinator you already have and gradually get the home economics people trained."
>
> "Encourage home economics teachers to take a course in principles and practices of Cooperative Education."

**Need To Interpret Programs to Students, Parents and Faculty**

In the opinion of teams from the participating communities, interpretation of the program to students and to parents should have high priority. Careful interpretation of the program assists in recruitment and reaching students in need of the program offered. Significant peer groups, parents, counselors, faculty and administrative personnel all directly or indirectly influence actual enrollment in courses.

Special meetings with potential and interested enrollees and with parent groups provide opportunities to help them understand the program and to raise questions. Involving students in describing their experiences and securing their reactions to the program are very convincing. Problems of "prestige," associated with certain occupational courses, are raised indirectly by parents and by students themselves. Since upgrading the titles of courses or occupations has a positive effect on the attitudes of people and the actual employment in the occupations, every effort should be made to scrutinize titles and to build-up the real significance of courses.

Interesting brochures for parents and students need to be prepared for the various clusters of occupations.

Interpretation of the program may be, and often is, most effective when people actually see what is happening to students who are enrolled in the course. For example, in food service courses which operate effective tearoom service there is visibility of the program and its effectiveness to faculty, students and others who may be guests. Educational and social approval are evident. Students feel this support and experience feelings of confidence and "self-worth" as they become increasingly competent.

The teams from the participating schools and the members from the evaluation panels continuously emphasized the following:

1. "Keep the point of focus on the students."
2. "Remember integration takes place in students."
3. "Highlight what is happening to students."

**Propose A Summer Program In Occupational Preparation**

One member of the evaluation panel suggested that in their community, when students are looking for jobs and are free to work, it may be a strategic time to have a "bang-up" summer occupational program. Such a program might have several possible advantages. There would be a natural setting for a work-study program; the facilities of the school would be available; the teacher could have a flexible time schedule; it might serve as an opportunity for the teacher to get some experience; it could conceivably be an opportunity to serve as a demonstration program including opportunities for teacher education.

**A Proposed Two-Year "People-Centered" Program**

Questions have been raised and discussed about the possibility of a broad "people-centered" occupational program at the high

school level, which would be focused on diversified job preparation in child care services, family services, health services and care of the elderly services.

Such an occupational program might have the following broad outline: (1) a semester orientation course available to students in grades ten to twelve, which would open up the diversity of home and community occupations and employment opportunities in the total cluster as illustrated in two recent publications made available in this project;[1] (2) four, one-semester courses of 180 hours each in child care services, family services, health services, and care of the elderly services; (3) diversified work experiences on weekends, after school or in summer programs; (4) a Co-Op course at the twelfth grade level for those who meet requirements in the area of greatest competence and interest in employment. Elective courses might be encouraged in home management, advanced homemaking, home nursing, home and family living, advanced foods or advanced clothing.

In discussions of the "people-centered" occupational program, there have been words of caution about focusing on, or limiting, the program to "home services." Some members of local teams have expressed concern about the problems of "prestige" associated with home services. There was general support for upgrading of course titles and content, and for a thoughtful community recruitment and action approach to solutions of prestige problems, if any, and to meeting employment needs and opportunities.

**Follow-up, Continuous Evaluation and Program Improvement**

A systematic follow-up of students who have completed occupational courses or programs is an integral part of occupational programs. Where are the students? What are they doing? How well are they doing? What are the strengths and weaknesses of the occupational program? How can the program be improved? Answers to these questions are important for program evaluation and improvement, for recruitment and interpretation.

MICHIGAN

The major objective of this project was to explore, use, and evaluate the cooperative approach of teacher education, leadership in the State Department of Education, and local action in initiating, planning, implementing, and evaluating occupational training programs related to home economics. Ten Michigan communities participated in the project. The project was organized into five phases: (1) In each community, three or more people knowledgeable about occupations studied employment opportunities, (2) Local teams, in a 2-week workshop, presented substantive content about occupational training and developed their local programs with assistance from specialists and consultants, (3) Local teams, in their communities, informed groups and stimulated interest in the programs, determined local resources, and made recommendations for actually implementing the programs, (4) All participating personnel met in clinical sessions to report progress, problems, help needed and proposed next steps, and (5) The project was evaluated by visits to the participating schools, written reports and publications, and judgment by the participants and a panel of specialists. Occupational programs were established in six communities and would possibly be developed in four others later. These programs included occupational orientation experiences, five included courses in food service and hospitality, one included a nurse aide course, one a general wage-earning course, and one five foods courses for adults. The workshop program, a list of participants, the agenda for the clinical sessions, reactions to and list of social action phases, letters, and forms ane included. The occupational home economics courses in each community are described in VT 004 796. (BS)

## ACKNOWLEDGEMENTS

The Division of Vocational Education, State of Michigan Department of Education funded the project: "Procedures for Establishment and Evaluation of Training Programs for Wage-Earning Occupations Related to Home Economics." Without their financial support, their consultant services and encouragement, this project would not have been possible.

The Advisory Committee served as an integral part of the project. Its members outlined the general design of the project and they contributed very generously to the various phases of the project.

The ten Michigan communities served significantly and imaginatively in their local action roles. Superintendents, principals, directors and coordinators of vocational education, counselors, home economics supervisors, home economics teachers - all contributed generously and shared their experiences with others. To these ten communities there is a deep sense of appreciation: Alpena, Gaylord, Grand Rapids, Lapeer, Menominee, Muskegon, Petoskey, Pontiac, Wayne and Wyandotte.

The two Evaluation Panels, one at Wayne State University and one at Western Michigan University assisted in synthesizing the findings of the project. Their assistance helped immeasurably.

The special consultants who presented substantive content at the Workshop and who participated in the Clinical Sessions added significantly to the understandings of all participants of the project.

Special appreciation is also extended to (1) Dr. Helen Lohr, President of the Michigan Home Economics Association 1964-66 and to the Chairmen of the Departments and Sections of the Michigan Home Economics Association for their assistance in providing names of persons knowledgeable about home economics and about occupations and (2) to the 136 individuals whose responses on the questionnaires made it possible to tentatively identify a group of home economics-related occupations.

Special appreciation is extended to Marlene Wamhoff, Deloris Cook, Alice Weiberg and Judith Lawrence who served so generously and effectively as part-time secretaries for the project.

# PREFACE

Decisions as to what will be done in Michigan in implementing the recent national legislation in vocational education as it relates to occupational preparation rests in many places and in many hands: The Division of Vocational Education, State Department of Education: colleges and universities; community and junior colleges, technical institutes, area vocational and technical centers and local schools and communities.

In the area of occupational preparation related to home economics, present curriculum patterns are subject to controversy and a general feeling of uneasiness seems to prevail. This is true at the local community level, in institutions of higher education and at the state level.

Occupational education in home economics is new. The question is: How can this newest field build experiences, validate, and refine procedures in establishing programs and in building new types of curricular offerings which provide for those most in need of occupational education?

The local school laboratory approach combined with institutional workshops and clinics appeared to have high potential learning value for all groups especially for leadership in vocational education.

A project entitled "Procedures for Establishment and Evaluation of Training Programs for Wage-Earning Occupations Related to Home Economics" was selected for use. It was essentially a cooperative approach of teacher education, leadership in the State Department of Education, Division of Vocational Education and local action.

The project consisted of five phases. Preliminary planning and preparation; Workshop at Michigan State University; the local community as a laboratory; Clinical Sessions at Michigan State University; and follow-up, evaluation and preparation of reports.

The project was exploratory for all participants. With the exception of the director of the project, the participants had no released time. Participants assumed the responsibilities involved in the research project as a part of their regular loads or on-going programs.

The Advisory Committee actively assisted in the various phases of the project including: recommending schools or communities to be invited to participate in the project: reacting to materials prepared as a part of the project; recommending and securing consultants as needed; recommending and approving plans for the summer workshop and the spring clinical sessions; evaluating the project.

Members of the Advisory Committee were:

Dr. Lawrence Borosage, College of Education, Michigan State University

Miss Barbara Gaylor, State of Michigan Department of Education, Vocational Education Division

Mr. Charles Langdon, State of Michigan Department of Education, Vocational Education Division

Dean Jeanette Lee, College of Home Economics, Michigan State University

Dr. Rosalind Mentzer, College of Home Economics, Michigan State University

Dr. Beatrice O'Donnell, College of Education, Michigan State University

Mrs. Rex Tood Withers, State of Michigan Department of Education, Vocational Education Division

During the final visit to the participating communities in May 1967, local teams were asked what they had learned about the establishment of programs for occupations related to home economics, which they believed would be of value to other communities. Their suggestions and recommendations have been included in this report. The Advisory Committee members and other specialists in vocational education assisted in reviewing the project and findings. Two evaluation panels, one at Wayne State University and one at Western Michigan University reviewed the project publications, and participated in conferences in their own institutions to assist in synthesizing the findings and indicating directions or emphases for home economics occupational education in the years ahead. The members of the evaluation panels were:

Dr. Willard Bateson, Wayne State University
Dr. Margaret Brennam, Western Michigan University
Dr. Eunice Herald, Western Michigan University
Dr. Gordon Johnson, Western Michigan University
Mrs. Bette LaChapelle, Wayne State University
Dr. George Leonard, Wayne State University
Dr. Marian McMillan, Wayne State University
Mrs. Gladys Rowe, Western Michigan University
Dr. Harold Silvius, Wayne State University
Dr. Robert Wurtz, Wayne State University

# CHAPTER I

## AN OVERVIEW OF THE PROJECT

### Statement of the Problem

This was an exploratory study involving ten communities in Michigan in the establishment and evaluation of occupational training programs related to home economics. It was essentially a cooperative approach of teacher education, leadership in the State Department of Education, Division of Vocational Education and local action.

### Importance and Need for the Study

Decisions as to what will be done in Michigan in implementing the recent national legislation in vocational education as it relates to occupational training in home economics rests in many places and in many hands: The Division of Vocational Education, State Department of Education; colleges and universities; community, junior colleges and technical institutes; local schools and communities including business, industry, labor, government agencies, health, homemakers, social service and professional groups.

The type and significance of response in Michigan may well be affected by: (1) the adequacy with which people understand the fundamental reasons why another role, other than that of education for homemaking and family life needs also to be assumed in home economics in some communities at this time; (2) the adequacy with which people understand the bases upon which occupational training programs related to home economics need to be built; (3) the extent to which school-community leaders and specialists in vocational education provide support and assist with know-how in the actual development of high level occupational training programs related to home economics; and (4) the extent to which an adequate number of home economists and others can and do become sufficiently knowledgeable and competent to participate when and where needed in various types of home economics-related occupational training programs.

In brief, the passage of the Vocational Education Act of 1963 mandates some new demands on the program in home economics. In addition to the changes in the conventional homemaking program, new dimensions of training for wage-earning occupations and the preparation of teachers to staff training programs present widely different problems and heavy responsibilities on local school administrators and on leaders in vocational education including home economics teacher educators.

New behavioral dimensions are implied which are foreign to many home economics educators, chief among them being the involvement of government agencies such as employment services, managerial personnel in business, industry, labor, and other groups. Other examples include: (1) the necessity of understanding legislation having an impact on workers; (2) the utilization of community resources such as business and industrial establishments as laboratories for learning; and (3) the securing of information from reliable and authorized services and reacting to the information.

In the area of occupational training programs related to home economics, present curriculum patterns are subject to controversy and a general feeling of uneasiness seems to prevail. This is true at the local community level, in institutions of higher education and at the State level. Since the federal legislation mandates that funds be spent for training in occupations related to home economics, it is not a question of whether the program of home economics should be expanded, but how.

## Possible Approaches and Basis for Selection of the Approach Used

There are at least two possible approaches for dealing with this situation. One alternative and perhaps the easiest one would be to extend, expand, or enrich the conventional and the traditional patterns of pre-service and in-service teacher education. Institutions of higher education would offer courses dealing with occupational training in home economics for teachers, supervisors or directors of vocational education on campus and in the field. These courses would be offered after school, on Saturdays and in the summer. Institutions of higher education and the State Department of Education would continue to provide consultant services to local schools upon invitation. However, these above methods have been shown to have certain weaknesses when measured in terms of bringing about changes or new behavioral dimensions at the community level.

Another alternative or approach, which is not new, would be to use the local situation as "on-the-job-laboratory" which would be combined with consultant services, institutional workshops and clinics. In this alternative, high priority would be given to the involvement of teams in local communities in defining, using and evaluating procedures or processes as they (1) determine home economics occupational training needs; (2) identify teacher supply and the training needs of potential teachers; (3) plan and implement local occupational training programs; (4) evaluate the effectiveness of their procedures; and (5) share their results with others. Thus the method of approaching the local situation of occupational education related to home economics would have a <u>high learning potential for all participants</u>: (1) consultants in the State Department of Education; (2) teacher educators and home economics faculty at the college or university level; (3) and personnel in local communities. The method would have a <u>high potential for applicability to other situations</u>.

The second type of approach has been in use for some thirty years. The Eight Year Study dramatized its early use with a group of local schools in the United States in planning, implementing, and evaluating changes in their high school programs. Since its initial introduction, the method of

"on-the-job-laboratory" combined with consultant services, institutional workshops and clinics has been used with various modifications in state curriculum programs involving local schools, state departments of education and institutions of higher education. The concept of action research to improve practices is closely related to this general approach.

In summary, the local-school-laboratory approach combined with the institutional workshops and clinics would have high value for all groups especially for leadership in vocational education. Occupational training in home economics is new. The question is: How can this newest field build experience, validate, test, and refine procedures for determining occupational training needs in representative Michigan communities? How can this newest field build experiences in cooperative planning with diverse groups in using new types of resources, in building new types of curricular offerings which provide for those most in need of occupational training?

## Objectives of the Project

The major objective of the project was to explore, use and evaluate the "cooperative approach of teacher education, leadership in the State Department of Education and local action" in the initiation, planning, implementation, and evaluation of occupational training programs related to home economics.

The specific objectives were:

1. To identify, use, and evaluate procedures for assisting local schools in:

   a. Securing evidence about needs for occupational training programs related to home economics in the specific communities
   b. Analyzing and interpreting the evidence about needs which they have collected

2. To explore alternative patterns for training programs based on interpretation of needs.

3. To explore procedures for discussion of findings with local groups as they make plans for implementation of programs and bring together the needs which have been isolated, the possible curricular patterns, and local teacher potential.

4. To identify, use and evaluate procedures for assisting local schools in:

   a. Describing the procedures actually used and reasons supporting their choices and rejections
   b. Evaluating their choices and in making recommendations for continued development of their programs
   c. Identifying areas of needed assistance in the continued development of their local programs

Clarification of Terms

In this study, "Occupations Related to Home Economics" was interpreted as (1) those occupations for which course outlines have been made available through the United States Department of Health, Education and Welfare and (2) occupations which have been identified or so categorized by leadership in professional groups. Examples are:

Service Occupations which are "home in focus." - -

Companion to an elderly person
The family dinner service specialist
Clothing maintenance specialist
Homemaker's assistant

Service Occupations which have a "community location." - -

Child day-care center worker
Supervised food service worker
Management aide in housing project
Hotel and motel housekeeping aide

"Establishment of needs for training programs" was interpreted as involving certain steps:

1. Identifying recommended policies, procedures and practices for establishment of needs relating to occupations and to groups to be served.

2. Making decisions about procedures which seem valid and feasible for actual use in their local communities and allocation of responsibilities and resources for the study of needs.

3. Organizing, analyzing, interpreting, and reporting the outcomes of their study of needs to school and community groups.

"Establishment of needs for training programs" was further interpreted as involving:

1. Identification of needs of the four major groups to be served under the Vocational Education Act of 1963.

   a. Persons attending high school;
   b. Persons who have completed or left high school and are available for full time study in preparation for entering the labor market;
   c. Persons who have already entered the labor market and who need training or retraining to achieve stability or advancement in employment;

d. Persons who have academic, socio-economic, or other handicaps that prevent them from succeeding in the regular vocational programs provided in the above paragraphs.

2. Identification of needs for teachers to staff local occupational training programs.

## Advisory Committee to the Project

In October 1964, the Chairman of the Department of Secondary Education and Curriculum, College of Education, Michigan State University appointed an Advisory Committee to the project on home economics occupational training. Members of the committee included:

Dr. Lawrence Borosage, College of Education, Michigan State University

Miss Barbara Gaylor, State of Michigan Department of Education, Vocational Education Division

Mr. Charles Langdon, State of Michigan Department of Education, Vocational Education Division

Dean Jeanette Lee, College of Home Economics, Michigan State University

Dr. Rosalind Mentzer, College of Home Economics, Michigan State University

Dr. Beatrice O'Donnell, College of Education, Michigan State University

Mrs. Rex Todd Withers, State of Michigan Department of Education, Vocational Education Division

The Committee actively assisted in the various phases of the project including: recommending schools or communities to be invited to participate in the project; reacting to materials prepared as a part of the project; recommending and securing consultants as needed; recommending and approving plans for the summer workshop and the spring clinical sessions; evaluating the project.

## Participating Communities

In April 1965, communities recommended by various members of the Advisory Committee, were sent invitations to participate in the project. The recommended communities, in the opinion of the committee members reasonably met the criteria which had been identified as important: (1) interest in and readiness to participate in such a project; (2) representativeness in size, character of the local community, socio-economic factors and occupational complex as interpreted by range and not average; (3) availability of leadership with special emphasis on released time to do the job of planning, supervision and implementation.

Ten communities accepted the invitation to participate: Alpena, Gaylord, Grand Rapids, Lapeer, Menominee, Muskegon, Petoskey, Pontiac, Wayne and Wyandotte. Several of the communities indicated some reluctance to accept the invitation because of heavy schedules and fear of "added responsibilities" growing out of the project. A few communities raised questions about financial support for local studies, attendance at the summer Workshop, and travel expenses. A few raised questions about the number of meetings to be scheduled.

## Organization of the Project and the General Time Schedule

The method of organization was essentially a combination of institutional and community strategy and dealt with five phases. The following was the adjusted time schedule.

| | | |
|---|---|---|
| Phase 1 | Preliminary planning and preparation<br>Local schools study needs | May-June, 1965 |
| Phase 2 | Workshop at Michigan State University<br>For teams from participating schools; presentation of substantive content by specialists; local teams work out plans in own communities | July 19-30, 1965 |
| Phase 3 | The Local Community as a Laboratory<br>Discussion, planning and implementation steps in local community | Fall 1965<br>Winter and Spring 1966 |
| Phase 4 | Clinical Sessions at Michigan State University<br>For teams from participating communities; discussion of problems encountered and progress made | May 1966 |
| Phase 5 | Follow-up and Evaluation<br>Visits to local schools and completion of written reports | Fall 1966<br>Winter 1967 |

The study was exploratory for all participants. With the exception of the director of the project, the participants had no released time. Participants assumed the responsibilities involved in the research project as a part of their regular loads or on-going programs.

## Funding of the Project

The project was funded by the Division of Vocational Education, State of Michigan Department of Education, for July 1, 1965 - June 30, 1966. However, because of time pressures in local communities and time pressures to complete publications and contractual obligations, two requests for extension of time were made to and were granted by the funding agency: (1) from June 30, 1966 to January 1, 1967 and (2) from January 1, 1967 to June 30, 1967.

# CHAPTER II

## DESCRIPTION OF PHASE 1 AND PHASE 2 OF THE PROJECT

This chapter includes descriptions of what was theoretically planned and what steps were implemented in the first two phases of the project. These two phases included preliminary planning in the local communities and the summer Workshop at Michigan State University.

### Theoretical Plans for Phase 1

Phase 1 of the project was theoretically regarded as a preliminary planning period in local communities. It was conceived as a period which would involve the selection of local teams and a study of local employment opportunities or employment needs.

#### Selection of local study teams

The following are excerpts from the project proposal:

> Each of the ten communities will select a team of three or more key people to participate. The team will be composed of representatives who have administrative support; are knowledgeable about vocational education on a broad base; have had experience with the various groups who are in need of occupational training; have had experience with or are knowledgeable about occupations or occupational training related to home economics.

It was suggested that the teams might include:

> A director of vocational education, head of department or a supervisor of home economics
>
> A representative from the local community college interested in exploring suitable occupational training programs in home economics
>
> A home economics teacher who had demonstrated interest in or who had experience in pre-occupational training and/or occupational training programs at the high school or post high school levels
>
> A teacher or potential teacher who had occupational experience and who had demonstrated special abilities or aptitudes to work with adults

A teacher or potential teacher who had demonstrated interest in and ability to work with groups having special needs

A counselor or visiting teacher who had demonstrated interest in meeting the special needs of groups who are in-school and/or who have left school before completion of the 12th grade.

Study of local needs

Theoretically it was assumed that prior to attending the summer workshop at Michigan State University the teams would be responsible for conducting some preliminary study of employment opportunities. Questions for which answers were sought in Phase 1 were: What are the needs for training programs (courses) for employment in occupations related to home economics? What is the potential teacher supply in the local community to staff such courses or programs?

The type of guidance or direction which was anticipated as probably needed in Phase 1 included bulletins or materials for possible use in local communities; field visits to the local communities to assist as needed; forms for reporting progress by local teams.

## Implementation Steps in Phase 1

Invitations to participate in the project were sent April 23, 1965 to superintendents of the communities recommended for participation in the project. After receiving either an acceptance of the invitation to participate or an expressed desire to further discuss the project, arrangements were made for a visit to each of the communities. These visits were made in May, 1965.

At the time of the initial visit to each community, the purposes and phases of the project were further discussed. In some cases there was hesitancy to accept commitments which might be beyond the resources of the local school or community.

Selection of local teams

The actual selection of local teams was not an obvious, rigid, closed or formal step. The so-called team consisted of those persons recognized by local administrators as most vitally concerned with occupational education related to home economics or as most likely to be involved. The "team" participating at the first meeting tended to be the continuing group. The composition of "teams" varied in the ten communities. In general they included: the superintendent, assistant superintendent or high school principal; the director of instruction, the director of vocational education, head of the home economics department or supervisor of home economics; home economics teacher or teachers representing senior and junior high school programs.

The persons involved had administrative support; were generally knowledgeable about vocational education; had experience with the secondary school program including junior and senior high school; were interested in occupational training programs related to home economics but had varying amount of experience in planning, teaching or supervising home economics-related occupational training courses or programs.

Study of local needs

At the time of the initial visits to the communities in May, 1965 there was considerable discussion of the vocational area studies, which were at various stages of being planned, in process or completed. In general, there were some feelings that employment opportunities in occupations related to home economics had not been and/or were not being adequately considered in the vocational area studies. However, local groups were hopeful that the findings would have some implications for home economics and that time would determine whether supplemental studies would be needed.

In one community the director of vocational education had surveyed, prior to the project, the employment opportunities for food service workers as a basis for determining the need for an occupational training program for high school students in grades 10-12. On the basis of replies from potential employers a need had been determined and action steps were taken to employ a qualified teacher and to secure adequate facilities.

In another community, needs had been determined through several sources including the local Michigan Employment Security Commission for food service workers, and motel housekeeping aids. Courses were being offered in food service.

In a third community, needs had been studied by the supervisor of home economics and programs primarily in the food service area were underway.

The director of the project developed some materials for use in the study of employment opportunities in occupations related to home economics.

## Theoretical Plans for Phase 2

Phase 2 of the project theoretically focused on the Workshop in an institutional setting for the teams from the ten participating schools or communities. The following are excerpts from the research proposal:

> The teams will be invited to participate in a two weeks workshop to be held at Michigan State University in July, 1965. The Workshop is being planned in close cooperation with the State Department of Education, Division of Vocational Education and the Advisory Committee to the project.

1. Specialists will present substantive content about occupational training.

   Morning sessions of the Workshop will be devoted to substantive content presented by four types of specialists: (1) those in state and federal agencies or groups involved in occupational training, legal aspects of employment, labor and management representatives, labor and industrial relations; (2) those in leadership positions in the field of vocational education; (3) those specifically identified with occupations related to home economics skills and knowledges; and (4) those concerned with communication.

2. Local teams will work on their local programs with assistance from specialists and consultants.

   Afternoon sessions of the Workshop will be devoted to group work by the local teams who will:

   a. Make use of information provided by the specialists.
   b. Study evidence they have collected about occupational training needs in their local communities (occupations and groups; teacher supply and training needs).
   c. Identify and explore alternative patterns for training programs or curricular arrangements based on interpretation of needs and availability of resources and new methods of working with others in vocational education.
   d. Explore possible procedures and strategy for discussions with local groups and for finalizing plans.

   Consultants and specialists will be provided to assist local teams.

3. Local teams will be provided with other types of guidance and assistance.

4. Local teams will prepare a written summary of Phase 2.

   Each local team will be provided with a general outline or guide for summarizing their achievement or progress in "Phase 2."

   Emphasis in the summary will be placed on their plans for next steps or for the period from August, 1965 to February, 1966 (Phase 3).

The following is a description of the Workshop as it appeared in the Michigan State University Time Schedule for Classes, Summer 1965. (Vol. 59, Number 10)

Workshop for Wage Earning Occupations in Home Economics

Ed. 881, 3 credits, Section 305, MTWTF 8-11. 1-3; 302 Ernst Bessey Hall, For teams from local schools interested in (1) studying evidence they

have collected about need for occupational training in home economics and in (2) making plans for local programs which they would attempt to implement in 1965-66.

Morning sessions will be devoted to substantive content taught by specialists. Afternoon sessions will consist of small group work in which plans for the next year will be made by local teams based on information from specialists, and analysis and interpretation of local data. Special consultants representing a wide variety of competencies will be available. Opportunities will be provided for working cooperatively with "back home" groups in finalizing plans.

## Implementation Steps in Phase 2

The Advisory Committee to the project was active in all stages of the Workshop. The Committee members were significantly helpful in assisting in the planning of the general design of the Workshop, including the type of substantive content needed and the names of consultants who would be knowledgeable in specific areas. The Advisory Committee members also served generously as consultants during the Workshop session.

## An Overview of the General Opportunities Provided Through the Workshop

A copy of the Workshop program is included in the Appendix. An analysis of the Program indicates that several general types of opportunities were provided. These tentatively have been classified as opportunities to:

1. Understand the research project and some of the commitments of the cooperating agencies.

2. Understand substantive content related to occupational training as discussed by knowledgeable leaders.

3. Understand area vocational studies including purposes and organization of studies, scheduled reports, findings from completed studies.

4. Hear about the variety of occupational training programs from knowledgeable persons who have been and are being involved in establishment of various types of programs in local communities.

5. Make some tentative plans for their "own situations" for use in discussions, planning, and/or implementation.

## Opportunities Provided for Discussion of the Home Economics Occupational Training Research Project

On the second day of the Workshop, the director of the project distributed and discussed materials describing the purposes and general plan of the Research Project. Some of the materials had been sent to the superintendents

at the time each was invited to be a participating community. Some of the superintendents had indicated that they wished to discuss the project before accepting the invitation to participate in it. The director of the project attempted to clarify the project on her first visit to the schools in May, 1965.

The Workshop participants received, in addition to the above mentioned materials, a copy of the research proposal. Emphasis in the discussion was placed on the cooperative relationships of the three professional groups involved, namely the local community, the State of Michigan Department of Education and Michigan State University, in their joint effort (1) to clarify procedures for establishment and evaluation of home economics occupational training programs; (2) to develop more "know-how;" (3) and to share their findings with others.

## Workshop Staff-Consultants and Representation from Participating Communities

The Workshop staff consisted of a director, twenty-three special consultants and one secretary-clerk. One member of the Home Economics and Family Life Education service of the Vocational Education Division, State of Michigan Department of Education, who was also a member of the Advisory Committee to the project, participated in most of the sessions, thus generally serving as a continuing State Department consultant.

At the Workshop, there was not full representation of the ten communities participating in the Home Economics Occupational Training Research Project. Five of the ten communities had full time representation; two had only limited or part-time representation; three had no representation.

In the spring of 1965, a few vocational directors and school administrators questioned if they should become participants in the project because of their inability to send representatives to the Summer Workshop or Phase 2 of the project. The Chairman of the Advisory Committee to the project, who was also the Chairman of the Home Economics Education Service at Michigan State University and the Director of the project together, agreed that participation in the project should not be denied to an interested community because of inability to have representation at the Summer Workshop. Later, when such questions were raised, local representatives were assured that while participation in the Workshop was regarded as important, every effort would be made to bridge the gap for the school unable to have representation at the Workshop.

The major reason projected for inability to participate in the Workshop clearly indicated that by the time invitations were extended to the local schools to participate in the project, some of the home economics teachers and most of the local directors had accepted other professional responsibilities. Some had made travel and/or vacation plans. One teacher needed to complete her requirements for the Masters degree.

Participants of the Workshop were home economists. In no realistic way did they represent "teams" from the local schools. Only in two schools was there more than one representative. In each of these, there were two

home economics teachers at the Workshop, thus approximating the "team" concept or "team" approach. In one of the participating schools, the local city supervisor of home economics was the representative. In general, the concept built into the research design that there would be teams from the local schools at the Workshop was implemented only to a limited degree.

Many letters of inquiry about the Workshop and requests for reservation to participate in the Workshop from persons outside of Michigan were received by the Chairman of Home Economics Education, Michigan State University. These persons were advised that the Workshop was part of a research project and would be limited to representatives from the participating communities. Later, two Michigan home economists were admitted to the Workshop. One was a part-time Michigan home economics teacher who had been asked by her superintendent to attend the Workshop. Another was a home economics teacher who was responsible for part of an educational food service program in a Michigan community.

A list of the Workshop participants is included in the Appendix.

## Facilities for the Workshop

The Workshop was scheduled at Ernst Bessey Hall in a large lecture type arm-chair classroom from 8:00 to 11:00 a.m. and from 1:00 to 3:00 p.m. Since the room was used by other classes during the day, the ordinary workshop facilities were generally lacking. On two occasions, special consultants could not continue their discussions with the workshop group after 11:00 o'clock because another class had been scheduled for the same room and was waiting outside the door. On four days, luncheon meetings were scheduled at the Union Building. The luncheon meetings made it possible to provide better facilities for not only the Workshop participants but for the special consultants and for interested faculty and graduate students in vocational education and in home economics. On these days, the Workshop group met the entire day using the Union Building facilities. Project funds were used to finance the luncheon meetings.

## Resource Materials Provided at the Workshop

Sixty per cent of the consultants provided single and/or duplicated copies of pertinent materials which they had used in their discussions of selected aspects of occupational training. These and other relevant materials were made available to each workshop participant throughout the two weeks session. Prior to the Workshop, the Director of the project had assembled available materials which she believed to be useful to the participants of the project. However, there was a normal delay in securing an official account number necessary for the use of any project funds. Because of this, a secretary could not be employed and/or materials could not be purchased prior to the first day of the Workshop. Reading materials were deposited in the Office of the Director of the project, Room 215 Erickson Hall, and/or made available through loans.

Categories of Substantive Content of the Workshop and Type of Specialist Responsible for the Presentation and Discussions

The following is a general breakdown of categories of the substantive content of the Workshop and the type of specialist responsible for the presentation and discussions.

| Categories or Foci of Substantive Content | Type of Specialist Responsible for Presentation and Discussion |
|---|---|
| 1. The status of women; the role of women in the labor market. | Dean of the College of Home Economics, Michigan State University |
| 2. "Mobilizing our potential" in home economics occupational training programs. | Head of Home Economics Unit, Vocational and Technical Education, U.S. Department of Health, Education and Welfare |
| The "position" of home economics in occupational training programs as presented in papers by leadership at the University of Illinois Conference, 1965. | Home economics education representative, Michigan State University, who attended the University of Illinois Conference |
| 3. Legislation, agencies and groups involved in home economics occupational training programs. | Professor, and Vocational Education Specialist, Michigan State University, with broad experience in labor, industry, business and education. |
| 4. Community involvement in initiating, developing and evaluating programs. | Professor, and Vocational Education Specialist, Michigan State University with broad experience in labor, industry, business and education. |
| | Specialist on social action and communication. |
| Use of social action steps in local communities. | A graduate student who had completed a special study including a summary of steps based on the social action rationale as it applies to home economics occupational training programs. |
| 5. Opportunities and challenges for working creatively within vocational education. | Chief of Home Economics and Family Life Education Service, State of Michigan Department of Education Vocational Education Division |

| Categories of Foci of Substantive Content | Type of Specialist Responsible for Presentation and Discussion |
|---|---|
| 6. Legal aspects of occupational training. | Consultant Trade and Industrial Education, Vocational Education Division, State of Michigan Department of Education, assuming responsibility in the Division for the legal aspects of occupational training. |
| 7. Staffing home economics occupational training programs. | Consultant, Home Economics and Family Life Service, Division of Vocational Education, State of Michigan Department of Education and Assistant Dean of the College of Home Economics, Michigan State University |
| 8. Criteria for providing facilities for home economics occupational training programs. | Chief of Home Economics and Family Life Education, Division of Vocational Education, State of Michigan Department of Education |
| 9. Pilot, demonstration and research programs in home economics occupational training. | Research specialist, Vocational and Technical Research, U.S. Department of Health, Education and Welfare |
| 10. Michigan vocational area studies. | Administrative Assistant, Division of Vocational Education, State of Michigan Department of Education |
| Report and findings of one Vocational Area Study. | Two members of the team from Michigan State University responsible for the Top of Michigan study - and other area studies |
| 11. Methods of studying existing and emerging occupations in agriculture. | Professor, Vocational Education, conducting and supervising studies using various methods. |
| 12. Reports of training programs. | Duplicated materials; classification of programs from the Illinois Teacher of Home Economics and from the American Vocational Association |
| | Duplicated copies of training programs prepared by the Manpower Development and Training Program for various occupations and the U.S. Department of Health, Education and Welfare, Office of Education |

| Categories or Foci of Substantive Content | Type of Specialist Responsible for Presentation and Discussion |
|---|---|
| Format for use in preparing Wage-Earning Outlines or Curriculum materials. | Specialist in Agricultural Education |
| 13. Description of courses and/or programs in some Michigan communities: | |
| Employment Up-grading program in Lansing School System | Teacher-coordinator of program; Counselor of program |
| Homemaker's Assistants, Adult Education program - Culturally deprived (ADC), Albion Community Schools | Home Economics teacher responsible for the development of the program; also Michigan participant in the Pennsylvania Workshop on Culturally Deprived |
| Homemaker's Assistant Program Detroit - Merrill Palmer | Director-Teacher of Training Project under the Manpower Development Training Act |
| Food Service Course, Pontiac Central High School | Director of Vocational and Adult Education, Pontiac |
| Food Service Training Program Lansing Public Schools | Head of Food Service Lansing Public Schools |
| Health Occupations - Training Programs in Michigan | Consultant, Health Occupations, Division of Vocational Education, State of Michigan Department of Education |
| Home Economics in Michigan Community Colleges | Graduate student who had completed research study |
| 14. Telling the home economics wage-earning or occupational training story in local communities | Assistant Director, Instructional Media Center, Michigan State University |

Formulation and Presentation of Tentative Long Time and/or Immediate Plans by Workshop Representatives from the Participating Communities

There were obvious limitations in the tentative plans made by the representatives of the participating communities. The teachers in general did not feel that they had adequate representation at the Workshop to do very real or significant planning. Findings were not available from the Vocational Area Studies or from the studies made by the Intermediate School Districts. There was an air of expectancy that the reports, when they would be available, would have very real implications for occupational training in home economics.

The Advisory Committee had recommended that school administrators and others in the communities represented be invited to participate in the discussion of the projected plans. However inadequate representation, the lack of data from the local area studies and time pressures resulted in the group's decision not to involve guests from their local schools or communities in discussion of their tentative plans. They felt that the plans could be more effectively discussed in their own local situations and at appropriate times following the Workshop. However, the plans were presented and discussed within the Workshop group and written plans were prepared by Workshop members.

Copies of the tentative plans made and presented by the Workshop members were duplicated after the Workshop session. Each of the Workshop members received ten or more copies of her own plans, which she could use as she thought best. These copies were made available during the fall visits to the communities.

## Evaluation of the Workshop Experience

Subjectively considered, the Workshop appeared to have been a stimulating and constructive experience for all concerned, namely the representatives from the participating communities, the consultants and the director of the project. It appeared to have served primarily as a base from which to move or work during 1965-66. It had communicative values; it had been a reinforcement experience; it had helped persons in leadership positions to sharpen the rationale for establishing and evaluating home economics occupational-training. Many questions remained unanswered for everyone. Some of the challenges seemed relatively clear but the way ahead seemed complex and beset with problems not yet resolved.

# CHAPTER III

## DESCRIPTION OF PHASE 3

Phase 3 focused on the community as a laboratory. For purposes of simplifying the research report full descriptions of the status of local programs and problems encountered at the end of Phase 3 are summarized as a part of Chapter IV Phase 4 - Clinical Sessions at which time local teams up-dated their reports of progress made.

### Theoretical Plans for Phase 3

This phase theoretically was conceived as encompassing approximately six or seven months during which time the teams would attempt to stimulate interest, determine local resources and finalize or implement their plans. Essentially it would involve:

generating or stimulating interest in occupational training programs in the local community;

discussing needed training programs for the four major groups identified in the Vocational Education Act of 1963 and for occupations categorized as using home economics knowledges and skills;

determining resources which would be available for the program (human and material);

making decisions cooperatively with local school administrators for actual "implementation-steps."

### Responsibilities of Local Teams

Responsibilities of local teams would involve:

#### Stimulating interest and informing groups of the needs and possible programs

The local teams would involve many types of groups; use mass media when possible; provide outside speakers; distribute brief reports.

Determining local resources

The local teams would make assessment of local material and human resources which could be used in program development. (This would involve budget; school facilities; teacher supply; teacher training facilities; agencies involved with training and employment.)

Finalizing plans; making recommendations or decisions cooperatively with local school administrators for actual "implementation-steps"

These plans would involve some long time and short time plans for implementation of local programs; provision for qualified teachers; facilities; cooperative arrangements within vocational education; advisory committees.

Responsibilities of the Director of the Project and Others

The Director of the project would provide certain types of assistance as needed. Some examples are:

Bulletins

Additional bulletins would be prepared if needs are evident (See Phases 1 and 2).

Field visits and consultant services

Field visits to each of the local schools or communities would be made by the Director of the project and representatives from the Division of Vocational Education, State Department of Education and Advisory Committee.

Other consultant services would be provided upon request from local schools.

Conferences or meetings

Conferences or meetings would be scheduled if needs are expressed.

Project forms for reporting progress

Project forms would be developed for reporting procedures used, decisions made and problems encountered in efforts to establish training programs for wage-earning occupations related to home economics.

Reports from the participating communities would be summarized and shared with all participating communities.

## Implementation Steps in Phase 3

Implementation steps in Phase 3 have been organized and described in relation to three categories of activities: (1) Post-Workshop Activities; (2) Identification of Home Economics-Related Occupations; and (3) Pre-Clinical Sessions Activities.

## Post-Workshop Activities

### Resource Files on Occupational Training Related to Home Economics

Since the project was designed to focus on procedures for establishment and evaluation of occupational training programs in home economics, the collection and organization of pertinent resource materials were regarded as basic.

Following the Workshop, (Phase 2), the search for and/or development of needed materials continued. Some preliminary attempts were made to organize the materials so they could be used effectively by local communities. From August 1 to September 1, 1965, five Resource Files on Occupational Training Related to Home Economics were tentatively organized for use in the project. The contents of each file are briefly indicated below:

1. Background materials; needs for occupational training; status of women; women in the labor force; the position of home economics in occupational training programs.

2. Guidelines for planning and establishing occupational training programs in home economics.

3. Descriptions of home economics wage-earning programs reported in the literature.

4. Further illustrations or descriptions of home economics occupaational training courses and programs (not reported in the literature, but available through other sources).

5. Suggestions for course format and Occupational Training Programs developed by the United States Department of Health, Education and Welfare, Office or Education.

The Resource Files were developed for and have served several purposes. They have provided some background materials for those communities that did not have representation at the Workshop. They have suggested gaps in which materials are needed. They have provided some basis for analysis of specific aspects of home economics occupational training programs.

### Fall Visits to Local Communities

Visits by the director of the project were made to the participating communities in September and October, 1965. In one community the fall visit was not made until December, when the school was ready for the visit.

Details about the date and time of the visit to the communities were approved by the local school superintendent or someone whom he designated. A form was used for securing reactions to the proposed dates.

From the end of the school year 1964-65, to the beginning of the new school year 1965-66, a number of changes in key administrative positions had been made in the schools or communities participating in the project. In three communities there had been changes in the office of superintendent and in two communities in the office of high school principal. In one community, a new position of vocational director had been added to the school staff. In another community a vocational director had been appointed to replace another director in the same school system.

In each of the communities it was necessary to further explain or discuss the purposes of the project. In the communities in which there had been important changes in personnel, the clarification of the project was of added importance. There had been limited representation at the Workshop in the summer 1965. There were other studies in which some of the communities were being involved. Some raised questions about the relationships, if any, between these projects or studies.

The five Resource Files on Occupational Training Related to Home Economics were explained and left in each school. There was considerable interest in the Resource Files and a belief that the materials would be helpful. Additional sets of the files were left to assist in expediting communication in the larger communities.

During the fall visits, local teams discussed their major concerns. In general, communities were waiting for the results of the vocational area studies or the results from studies made by the intermediate school districts. In some communities concern was expressed for the possible need to make supplementary studies of employment opportunities in occupations related to home economics.

In each of the participating communities, there was a genuine concern about: (1) the potentialities of home economics in education for wage-earning; (2) specific home economics-related occupations or clusters of occupations for which courses might be anticipated or considered a possibility; and (3) appropriate "curricular designs" which would be flexible and appropriate within the total framework of general education, vocational education and home economics education.

In several schools the possibilities of planning and offering a home economics occupational orientation course at the high school level was discussed. In one senior high school such a course was being taught for the first time. Twenty 11th and 12th grade students were enrolled. It was a one year elective course. In one junior high school a home economics teacher was attempting to interest potential drop-outs, who were in her regular 9th grade home economics classes, to think about their future, including reasons for remaining in school, the possibilities for wage-earning and occupational training. This she was doing through a series of planned visual materials posted on the bulletin board once a week. Occasional discussions during each week focused on reactions and bringing out specific teaching points. One school was offering an Orientation Course in Food Services. Flexible

scheduling has made it possible for students to elect this course in the 9th, 10th or 11th grades. Other schools were considering offering occupational orientation courses as an important step in getting programs underway.

In two senior high schools food service occupational training courses were being offered in which students had realistic occupational work experiences in the various phases involved in the preparation and service of faculty luncheons. In another community, a food service course was being offered for up-grading of the food industry and another course was being planned at the junior college level for mid-management personnel for the food service industry. In one community, plans were being made by the local vocational director and home economics teacher to include home economics in the on-going Co-Op program.

## Special Meeting for Participants of the Project

Several school administrators had indicated that attendance at special meetings called as a part of the project would not be desirable from their point of view. This, they explained, was due to several factors, including: (1) the financial costs of travel; (2) the financial costs and difficulties in employing substitute teachers; and (3) the risks of detrimental effects on classroom instruction and learning. The director of the project respected these expressions.

Because the Annual Michigan Conference for Home Economics Teachers is usually attended by six to seven hundred home economics teachers, a plan was worked out by which at the fall 1965 Conference at Grand Rapids, representatives from the participating communities would have an opportunity to "get together" for an informal discussion. The proposed plan met with the general approval and seemed to offer many values for everyone.

Miss Rua Van Horn, formerly of the United States Department of Health, Education, and Welfare, Office of Education and a nationally known consultant on home economics occupational training, was to be the main speaker for the evening session, November 12, 1965. Through the cooperation of the Chief of Home Economics and Family Life, Division of Vocational Education, State of Michigan Department of Education, arrangements were made with Miss Van Horn to meet the teachers from the participating communities. Following her acceptance to meet with the group, letters were sent to the superintendents inviting the home economics teachers and others who would be in attendance at the State Conference to attend the special meeting with Miss Van Horn. The meeting was scheduled for 9:00 p.m., Room 318, Pantlind Hotel, November 12, 1965. Other special guests who were invited to participate included: (1) the Advisory Committee to the project; (2) Mrs. Gertrude S. Capps, Supervisor of Home Economics, Detroit Public Schools; and (3) Mrs. Marjory Trott, Supervisor of Personal Services, Detroit Public Schools.

Twelve representatives from six of the participating communities attended the special meeting in which Miss Rua Van Horn served as special consultant. Four communities were not represented. The agenda included: (1) a brief discussion of the project, (2) progress and problems in local communities.

The home economics teachers from the participating communities raised questions and discussed (1) problems involved in making local surveys of occupational opportunities and (2) the problem of identification of occupations which are home economics related. Miss Van Horn indicated that the problem of interpretation of home economics was a general problem which had been experienced in all the states. She also suggested that the teachers work with the local Y.W.C.A. in securing leads. She reported that other communities had found this organization to be very helpful.

There was considerable support from Miss Van Horn to plan Occupational Orientation courses as an initial step in the development of high school programs. The group expressed very great appreciation for Miss Van Horn's contribution; she had given significant help.

Following the meeting with Miss Van Horn, packets of supplemental materials to be added to the Resource Files were distributed to the representatives from the participating schools. For those who were not in attendance, the materials were sent.

## Progress Reports from Participating Communities

In January 1966, the participating communities were asked to submit a progress report of the problems they had encountered and the status of their occupational training programs in home economics. A copy of the form provided for their use in reporting is included in the Appendix.

Reports were received from each of the ten communities. On the basis of the reports received, it was possible to prepare a written progress report without distorting the comments or losing the ideas from individual communities. The report was entitled "A Progress Report - Highlights of Activities, Emphases, Procedures and Achievement in Communities Participating in the Project." This report was made available to the local teams during the spring visit and at the Clinical Sessions in May.

## Identification of Home Economics-Related Occupations

In the theoretical plans for Phases 1, 2 and 3 it was indicated that specific bulletins would be prepared when evidence of need was indicated. The problem of interpretation of home economics in the total program of preparation for wage-earning seemed to be a crucial problem both from the immediate and the long time view. The question was "Could some satisfactory resource materials be prepared within the framework and resources of the project which would: (1) be useful or functional to the communities participating in the project and also to other communities; (2) specifically focus on the interpretation of the potentialities or the scope of home economics; (3) identify and describe home economics-related occupations?"

Both indirect and direct methods were used. Basically it was exploratory and a learning situation for the director of the project and others.

Description of Indirect and Exploratory Attempts to Interpret the Scope of Home Economics.

The director of the project attended seven professional meetings in which occupational training was implied or directly discussed. Her attendance at these meetings assisted in roughly ascertaining the status of certain occupational training programs, the concerns and problems of groups and their attitudes concerning the potentialities of home economics. The following meetings were attended from October 21, 1965 to January 24, 1966:

| | |
|---|---|
| October 21, 1965 | Food Service Educators<br>Waterford Township High School |
| November 16, 1965 | Michigan Educational Research Council-<br>"Research and Special Projects-"<br>Detroit Board of Education |
| November 30, 1965 | Food Service Educators, Wilbur Wright, Detroit |
| December 3, 1965 | College of Home Economics, Michigan State University Administrative staff - concerned with in-service requests regarding occupational training - Dean's office |
| December 15, 1965 | State of Michigan Department of Education Conference, Headstart, Union Building, Michigan State University |
| December 27-30, 1965 | Annual National meeting - Council for Hotel, Restaurant and Institutional Educators, Detroit |
| January 24, 1965 | Meeting of the Michigan Home Economics Teacher Educators regarding Home Economics Occupational Training - Special consultant Dr. Berenice Mallory, United States Office of Education |

Three of the above meetings involved food service educators. At each of the meetings there was at least one representative from a community participating in the research project. It was informally observed that the food service educators had within their groups experienced teachers with nationally recognized occupationally-focused programs. Within the groups were included a responsible experienced group of home economists and others with occupational and teaching experience. They were involved in occupationally oriented courses or programs in vocational and technical schools, high schools, post high school programs, and community college, college and university programs. All were seriously attempting to accelerate their efforts and programs. Some were in processes of developing courses and curriculum materials which would be mutually helpful. At the annual national meeting of the Council for Hotel, Restaurant and Institutional Educators, it was observed that home economists were working side by side with the various groups and that they were being involved in nationally recognized research projects.

The Detroit Board of Education representatives indicated at the meeting of the Michigan Educational Research Council that they were using a broad coordinated attack on the multi-problems of education, poverty and occupational training. Their emphasis was coordinated action. They had realistic and obvious concerns and programs for children and families, characterized by cultural deprivation. In their Headstart program elementary school teachers, who were interested in participating, were employed as the teachers. During the meeting, it was learned that a coordinator of child care services had been employed by the Detroit Board of Education. Their plans included expansion of services to pre-school children; after-school care of children and parent education, including provisions for homemaker's assistants to help families.

At the meeting December 15, 1965 called by the State of Michigan Department of Education for personnel interested in establishing Headstart programs, day care centers for children of culturally deprived families, there was evidence of leadership from several types of state agencies, services or disciplines. Two members of the College of Home Economics faculty, Michigan State University, had been involved in the summer 1965 and would be involved in summer 1966 in a training program for Headstart personnel. They participated on the panel discussions with representatives from the Michigan Department of Social Service and the Department of Health.

At the meeting of the Michigan Home Economics Teacher Educators, January 24, 1966, Dr. Berenice Mallory, Head of Home Economics Unit, Technical and Vocational Education, United States Office of Education, indicated the need for guidance and public relations materials which would help people understand the occupational opportunities in home economics. Dr. Mallory also reported that at the special meeting in Chicago for State Supervisors of Home Economics, there was emphasis on the need for "flexibility" in the establishment of occupational training programs for home economics.

The director of the project also purposefully held conferences with key representatives of groups involved in employment services, occupational training programs or professional services, including state government agencies or departments. The interest and attitudes of and the suggestions from these key individuals were very constructive and challenging.

<u>October 22, 1965</u> <u>Health Occupations - Division of Vocational Education, Trade and Industrial Education, Michigan Department of Education - Mrs. Lottie Waterman</u>

A conference was scheduled with Mrs. Waterman in her office in the Bauch Building.

The discussion centered on the need for identification of occupations in home economics-health related occupations. Reactions were secured to some lists of occupations. Mrs. Waterman reacted to these and made some helpful suggestions.

Mrs. Waterman volunteered to share some new materials which she had received. She indicated interest in giving further assistance.

October 26, 1965 Manpower Training, Division of Vocational Education, State of Michigan, Department of Education - Mr. William Pierce

The conference with Mr. Pierce was held jointly with Mrs. Rex Todd Withers and Barbara Gaylor, Division of Vocational Education, Michigan Department of Education.

Information was secured about projects which had been approved under Manpower Training for 1965-66. A summary report was provided.

Mr. Pierce discussed the problem of home economics and its identification with certain "lower level" occupations and what the effect might be. He suggested that a total look was important - for occupations at upper education levels.

Mr. Pierce supported the effort to identify occupations which use home economics knowledges and skills.

November 2, 1965 Michigan Employment Security Commission, Lansing Office Mr. Glen Stockton, Assistant Manager of MESC, and Mrs. Dorothy NeSmith, MESC

The conference was held in the Lansing Office of the Michigan Employment Security Commission.

Miss Barbara Gaylor, Division of Vocational Education, Michigan Department of Education, also participated in this conference.

Mr. Stockton and Mrs. NeSmith discussed employment opportunities and placement problems in occupations related to home services. They had experienced some problems.

Reactions were secured to a proposed questionnaire to determine employment opportunities to be used in one of the participating schools. The questionnaire was revised later as proposed by Mr. Stockton.

November 5, 1966 School of Labor and Industrial Relations, Michigan State University - Dr. Sigmund Nosow, Associate Researcher

A conference was scheduled with Dr. Nosow in his office to discuss the representativeness of the schools in the project. The problems of interpretation of occupations which use home economics knowledges and skills were discussed. Dr. Nosow made some suggestions and recommendations for identifying home economics occupations.

He indicated that identifying home economics-related occupations could be a major contribution of the project.

November 29, 1965 Michigan Employment Security Commission, 7310 Woodward Avenue, Detroit - Eugene L. Bodoh, Occupation Research

A conference was held with Mr. Bodoh in the Detroit MESC office at 7310 Woodward Avenue. Mr. Bodoh indicated the magnitude of the task of identifying home economics-related occupations and estimated a possible cost of $30,000.

He also indicated the complexity of securing data about employment opportunities and the many assumptions which are made. He pointed out and gave illustrations of dangers and pitfalls.

He was interested in continuing the discussion at another time.

December 1, 1965 Hotel, Restaurant and Institutional Management, Director - Henry O. Barbour, Eppley Center, Michigan State University

The conference was held in Professor Barbour's office in Eppley Center. The supervisor of home economics and staff in Grand Rapids were interested in planning a mid-management course in food service which could be offered in the Grand Rapids Junior College.

Miss Eleanor Tumath, Supervisor of Home Economics and a group of selected teachers who had masters degrees and were institutional administration or dietetics majors were interested in enrolling for graduate credit and securing the help from Professor Barbour's specialists. They had indicated special interest in securing the assistance of Gladys Knight, who had worked with them on previous occasions.

Professor Barbour was very helpful. He suggested the course in which they should enroll and indicated that Gladys Knight could serve as a consultant. He was very generous with materials which he thought would be helpful for the Grand Rapids group.

Personnel in the State of Michigan Departments of Social Service, Mental Health, Agriculture and Labor were contacted by telephone. These telephone conversations provided important clues and information. Personnel in the College of Home Economics and the School of Social Work at Michigan State University were also contacted. In all conversations there was interest in an attempt to identify the occupations which are home economics-related.

## Description of Direct Attempts to Identify and Describe Home Economics-Related Occupations

In January 1966, a more direct but still exploratory plan was developed with and approved by the Advisory Committee, as suitable within the framework of the project, even if certain risks seemed to be involved and the resources

limited. The plan consisted of the following steps:

1. Select from the Dictionary of Occupational Titles, Third Edition, 1965, those occupations which appear to be home economics-related.

2. Classify the selected occupations into appropriate or meaningful clusters.

3. Secure the reactions or value-judgments of persons knowledgeable about occupations and about home economics as to the extent home economics or one of its subject-matter areas would be needed for job competence or job training.

4. Use the findings in preparation of some materials which could be used tentatively by local communities.

The general plan was discussed with the Executive Board of the Michigan Home Economics Association at its January 1966 meeting. The Board reacted favorably and agreed to recommend persons who in their opinion were knowledgeable about home economics and about occupations. A letter of explanation and a form for reporting names were sent to Board Members.

At a later date the participating communities in the project also submitted names especially of employer groups whom they believed to be knowledgeable about occupations within specific clusters.

The director of the project carefully read the titles and descriptions of occupations as reported in the Dictionary of Occupational Titles, Third Edition, Volume I and selected occupations which appeared to be related to home economics and/or one of its subject matter areas. Three home economics teachers who were advanced graduate students also made independent selections. Lists were studied and compared. Resources did not permit a careful follow-through of differences and similarities in the lists, however, counts were made.

A "reasonable list" was made of occupations which appeared to be home economics-related. Brief descriptions of each occupation as quoted from the Dictionary of Occupational Titles were also included. The lists were alphabetically organized into eight clusters: (1) Child Care Services; (2) Family Services; (3) Care of the Elderly Services; (4) Health Services; (5) Clothing Services; (6) Food Services; (7) Housing and Home Furnishings Services; and (8) Cleaning, Dry-Cleaning, Laundry and Dyeing Services. The report was entitled "Description, Classification, and Index of Occupations Which Use Various Home Economics Knowledges and Skills." It was distributed to the participating communities during the spring visits 1966.

In general the local teams reacted favorably to the content and format. One director of vocational education suggested including the official occupational number. This suggestion was incorporated later in the final materials prepared.

In May 1966, a questionnaire was prepared for each of the above clusters with the occupations alphabetically arranged. The title of the occupation and a brief description of the occupation were quoted from Volume I of the Dictionary of Occupational Titles. Respondents were asked to check in appropriate colums their reactions to two questions:

1. Is the occupation related to the cluster in which it is classified?

   Yes  No  Uncertain

2. To what extent is home economics and/or one of its subject matter areas needed for job competence or effective job training?

   Great  Considerable  Little or No  Uncertain

For each of the occupations listed the respondents were also asked to provide free responses to the question: "What other business or professional groups are involved?"

The questionnaires were sent to persons recommended by the members of the Executive Board of the Michigan Home Economics Association. A copy of the letter accompanying the questionnaire is included in the Appendix.

The responses were summarized for each of the occupations listed. If 50 percent or more of the respondents within each panel indicated that they believed home economics was needed to a "great extent" or "considerable extent" for job competence or for effective job training, the occupation was tentatively regarded as "home economics-related." Table 1 summarizes the responses of the panel members for occupations within each cluster. (See page 31.)

The reactions or value judgments of panel members were used in the preparation of a tentative list of home economics-related occupations. Two changes in organization of clusters were made. The four clusters of Child Care Services, Family Services, Care of the Elderly Services and Health Services were combined into one major cluster. This reduced or minimized the problem of classification, over-lapping or duplication.

The original single cluster of Cleaning, Dry-cleaning, Laundry and Dyeing Services was divided into two clusters: (1) Dry-cleaning and Laundry Services and (2) Non-Domestic Cleaning, Housekeeping and Miscellaneous Services.

Table 2 (see page 32) presents a summary of the number of occupations within each of the six revised clusters which met the 50 percent criterion, and were tentatively regarded as home economics-related.

The results from the above indirect and direct efforts to interpret home economics in the spectrum of wage-earning have been incorporated in several publications which are described in Chapter V or Phase 5 of the project.

TABLE 1

DISTRIBUTION OF OCCUPATIONS WITHIN EIGHT CLUSTERS

IDENTIFIED AS HOME ECONOMICS-RELATED BY PANEL MEMBERS

| Cluster | Number of Panel Members | Number of Occupations | Number Which met 50% Criterion | Number Which failed to meet 50% Criterion |
|---|---|---|---|---|
| 1 Child Care Services | 16 | 24 | 18 | 6 |
| 2 Family Services | 20 | 33 | 30 | 3 |
| 3 Care of the Elderly | 20 | 11 | 5 | 6 |
| 4 Health Services | 20 | 27 | 18 | 9 |
| 5 Clothing, Textiles and Related Art | 16 | 61 | 45 | 16 |
| 6 Foods and Nutrition | 20 | 69 | 47 | 22 |
| 7 Housing and Home Furnishings and Related Art | 14 | 41 | 19 | 22 |
| 8 Cleaning, Dry Cleaning, Laundry and Dyeing Services | 10 | 41 | 28 | 13 |
| | 136 | 307 | 210 | 97 |

TABLE 2

DISTRIBUTION OF HOME ECONOMICS-RELATED OCCUPATIONS

WITHIN THE REVISED LIST OF SIX CLUSTERS

| Revised Clusters | Occupations Listed |
|---|---|
| 1 Child Care, Family, Care of the Elderly and Health Services | 48 |
| 2 Clothing, Textiles and Related Art | 44 |
| 3 Foods and Nutrition | 48 |
| 4 Housing, Home Furnishings, Equipment and Related Art | 17 |
| 5 Dry-Cleaning, and Laundry Services | 19 |
| 6 Non-Domestic Cleaning, House Keeping and Miscellaneous Services | 9 |
| Total Number | 185 |

## Pre-Clinical Sessions Activities

The Pre-Clinical Session-Activities consisted primarily in making tentative plans for the Clinical Sessions and the spring visits to the participating communities.

### Pre-Planning for the Clinical Sessions

The plans for the Clinical Sessions were discussed with and approved by the Advisory Committee. Commitments for financing costs and reimbursing teams from participating communities were cleared through the Division of Vocational Education, the funding agency, and Michigan State University. A one page announcement and invitation describing the Clinical Sessions and a tentative agenda were prepared and included in correspondence with the participating communities.

The design for the Clinical Sessions would provide opportunities for local teams from the communities participating in the project to describe the procedures used in establishment of their home economics occupational training programs, the problems encountered and the status of their programs as of May, 1966. Their oral reports or presentations would supplement the written reports as of February 1966.

Special consultants and members of the Advisory Committee would be present. They would listen to reports, raise questions, and make suggestions where appropriate.

Local teams would have an opportunity to make suggestions for the improvement of the Agenda for the Clinical Sessions.

## Spring Visits to the Participating Communities

In March and April 1966 visits were made to the participating communities to discuss the progress being made in the project and the Clinical Sessions. There were favorable responses to two sets of materials which were distributed: (1) the report entitled "Description, Classification, and Index of Occupations Which Use Various Home Economics Knowledges and Skills" and (2) "A Progress Report--Highlights of Activities, Emphases, Procedures, and Achievement in Communities Participating in the Project."

Teams from seven of the communities accepted responsibilities for describing their local programs as indicated on the proposed agenda for the Clinical Sessions. In one community there was an uncertainty as to whether they could have representation at the Clinical Sessions. In two communities the teams indicated that it would not be possible to participate in the Clinical Sessions because of important commitments in their local school programs.

# CHAPTER IV

## DESCRIPTION OF PHASE 4 OF THE PROJECT

### Theoretical Plans for Phase 4

It was theoretically planned that in the spring of 1966, the local teams would return to Michigan State University for a two or three day professional experience referred to as "Phase 4 - Clinical Sessions."

### Emphasis for the Clinical Sessions

At the Clinical Sessions, the teams from the participating communities would discuss: (1) progress which had been made in their local communities in the establishment and evaluation of training programs for wage-earning occupations related to home economics; (2) some problems which had been encountered; and (3) some next steps and help needed.

### Availability of Special Consultants

It was also theoretically planned that the services of special consultants would be secured in assisting local teams to take a look at the progress made, problems encountered and next steps. Assistance to groups would be made available to see possibilities for research studies at the local level, sources of funds, and types of assistance which might be provided in writing research proposals.

### Implementation Steps in Phase 4

The implementation steps in Phase 4 are described below in three categories: (1) general description of the Clinical Sessions; (2) an overview of progress made in local communities, problems encountered and assistance desired; (3) description of home economics related occupational courses offered and/or planned.

### General Description of the Clinical Sessions

The Clinical Sessions were held at the Jack Tar Hotel, Lansing, on May 11, 1966. Considering the responses from the various communities, it seemed wise to limit the Sessions to one day.

### Purposes of the Clinical Sessions

The purposes of the Clinical Sessions as interpreted to the participating communities were to: (1) share progress made in establishment and evaluation

of home economics occupational training programs and to identify successes and problems; and (2) share ideas or suggestions for next steps in program development and evaluation.

## Participants at the Clinical Sessions

Twenty-eight persons participated in the Clinical Sessions. Of these, sixteen were from the participating communities; six were from the Division of Vocational Education, State of Michigan Department of Education; three were from Michigan State University; and three were graduate students at Michigan State University. A list of participants is included in the Appendix.

## General Design of the Sessions

The Clinical Sessions were planned to provide opportunity for the teams from the participating communities to personally describe the progress which had been made in their own communities in the establishment and evaluation of home economics occupational training and to raise questions about their own efforts and/or the procedures used in other communities.

The members of the Advisory Committee and consultants from the Division of Vocational Education listened to the reports and discussions and raised questions or made comments when it seemed appropriate.

A portfolio of materials was provided for each of the participants. It contained materials which would facilitate communication at the Clinical Sessions. It contained: (1) a list of names of persons who had planned to attend the Clinical Sessions; (2) a copy of the Agenda for the Sessions; (3) a copy of "A Progress Report - Highlights of Activities, Emphases, Procedures and Achievement in Communities Participating in the Project;" (4) materials submitted by the participating communities for use at the Clinical Sessions to assist in describing their local programs or their projected plans; (5) brief progress reports of special studies related to home economics occupational training programs completed by graduate students at Michigan State University; and (6) some tentative suggestions for organization of an occupational training program at the secondary level geared to home and institutional services in the cluster of the family, child care, care of the elderly and health services.

Some time was allowed for the discussion of procedures for or problems experienced in submitting home economics occupational training programs for vocational reimbursement.

A copy of the Agenda is included in the Appendix.

## Evaluation of the Sessions

Comments from both the local teams and the consultants indicated that it had been a profitable experience. It had been a "full day" and no doubt one day was insufficient. The local teams tended to feel confident although some had been able to make less progress than they had hoped for.

## An Overview of Progress Made in Local Communities, Problems Encountered and Assistance Desired

Progress made and problems encountered in the participating communities are described below in relation to five categories: (1) explaining or interpreting home economics in occupational training; (2) establishing evidence of need; (3) using community and advisory groups; (4) planning and administering the Co-Op program (5) planning and developing the total home economics occupational program.

### Explaining or Interpreting the Potential Contribution of Home Economics

Attempts had been made in nine of the ten participating communities to interpret or explain the potential contribution of home economics in wage-earning or occupational training programs. Groups which had been involved in interpretation included: school faculty; employer group- businessmen; citizens' advisory committees; counselors; pupils in occupational orientation classes and in school assembly programs.

Both successes and difficulties had been encountered. There was consensus that materials were needed to assist local groups in identifying more specifically home economics-related occupations.

Following are quotations from reports submitted by the participating schools.

Alpena "I've explained what we plan to do during a faculty meeting devoted to occupational training. I've also spent much time talking to local businessmen as have the three other home economics teachers. Plans were explained to AAUW members and to high school classes from 7th to 11th grades."

Gaylord

Grand Rapids "We have worked with principals and counselors, but mainly in explaining and interpreting the potential of the food services industry only. Assembly programs have also been used."

Lapeer "The potential contribution of occupational training in home economics has been interpreted to key people in our school system and in our community. These people agree that there is a contribution to be made in this area."

Menominee "I gather from the bits of evidence which have come to my attention that I am not alone in confusion about the basic proposition. No matter whose definition is used, there is no definite answer to some of the common questions that arise. For example: Is a chef a tradesman? Should he be enrolled in T and I? How about meat cutters, bakers? These all have their preparatory counterparts in 'traditional homemaking,' yet I get the feeling that H. E. people are uninterested or frightened by mention of these occupations."

Muskegon "Helen Funk and Ruth Ingalls (home economics teachers) have had several conferences with counselors, informing them of the new trend in home economics. Counselors have been very receptive and interested."

Petoskey "Since preparation for wage-earning is a relatively new aspect of the home economics program, it has been necessary to explain what is meant by occupations which are related to home economics. The home economics teacher has attempted to explain to the faculty, parents and students the possibilities of wage-earning occupations related to home economics.

Few resource materials are available which adequately interpret home economics below the college level. A great deal of the teacher's time was devoted to 'tracking down' resource materials which would be useable in the new home economics occupational orientation course which was offered for the first time 1965-66."

Pontiac "Administrators in Pontiac have seen the contribution such programs make and supported us in every situation. Students having attendance and emotional problems are not allowed in the food service program."

Wayne "The Wayne Community School District is very fortunate to have a strong program in the area of home economics. The home economics program has been successful because the well qualified staff of teachers has worked very hard to establish a well defined program. This success, coupled with the current emphasis on vocational training, makes the task of interpreting the potential contribution of home economics in occupational training relatively easy. A strong citizens' advisory committee for vocational education also makes contributions with regard to advising, informing, and supporting programs related to home economics."

Wyandotte "It is very difficult to explain the potential contribution at this stage. Difficulty has been experienced in classifying jobs which use home economics knowledges and skills. Effort has been made to identify or classify home economics-related jobs which are acceptable to the Michigan Employment Security Commission."

## Establishing Evidence of Need for Training in Occupations Related to Home Economics

Each of the ten participating communities reported some progress in establishment of need for training in occupations related to home economics. However, less effort and progress had been made in establishment of needs within the total scope of home economics than in the establishment of need within a single cluster.

Reports from national, state or local studies had been used to establish evidence of employment opportunities or need for home economics-related occupational education programs. The major sources consisted of: (1) reports of vocational-technical area studies; (2) the Michigan Security Commission; (3) local surveys; and (4) routine checking of "employment ads" in the newspapers.

Seven of the communities participating in the project had been involved in vocational-technical area studies. No reports were available to the participating communities during Phase 1 and Phase 2 of the project, although oral reports and some of the findings were reported at the Workshop on one study, "Improving Vocational-Technical Education in the Top O' Michigan Area."

Table 3 indicates that the reports from vocational-technical area studies were available to the participants at various stages of the project, especially in Phases 3 and 4.

Some successes and difficulties had been encountered in establishing need for training in occupations related to home economics. Several communities indicated that they did not believe that the occupational opportunities or needs for training programs related to home economics had been adequately explored. Evidence of employment opportunities had been presented for food service workers, housekeeping aides and health workers.

TABLE 3

AVAILABILITY OF THE VOCATIONAL-TECHNICAL AREA STUDIES TO

COMMUNITIES PARTICIPATING IN THE PROJECT

| Date of Report | Title of Vocational-Technical Report | Community |
|---|---|---|
| October 1965 | Improving Vocational-Technical Education in the Top O' Michigan Area | Petoskey Gaylord |
| October 1965 | Meeting Employment Needs | Muskegon |
| February 1966 | A Study in Futures Vocational-Technical Education Study | Menominee |
| April 1966 | Report Kent County Vocational-Technical Education Survey Kent County, Michigan | Grand Rapids |
| May 1966 | Improving Vocational-Technical Education in the Thunder Bay Area | Alpena |
| September 1966 | Improving Vocational Education in Lapeer County | Lapeer |

Alpena

Needs within the wide potential scope of home economics "We've contacted clothing stores. They were not interested in alterationists, as their work is done in private homes. Motel owners preferred to train their own personnel and preferred mature married women except one who was a board member. Bakers preferred to train their own. In most cases the business was a family proposition. Dry cleaners preferred training their own help. Employers, except those who served liquor, were interested in waitress-training."

Needs within one occupational cluster "Until we receive the results of the Area Study survey, it appears that waitress training and short order cook training (Food Service) will be all we will train for. Our retail sales classes do an excellent job of preparing students for clerking. We plan to do some team teaching with the retail sales teachers in yardage, etc."

Gaylord

Needs within the wide potential scope of home economics "We had no difficulty in establishing evidence of need."

Needs within one occupational cluster "Need was established by a survey of local motel and restaurant owners and operations for housekeeping aides and waitresses."

Grand Rapids

Needs within the wide potential scope of home economics "The only evidence has been through the area studies and this had been in a limited way in relation to the total scope of home economics."

Needs within the one occupational cluster "An informal survey of food service directors of restaurants, hospitals and hotels in Grand Rapids was made."

Lapeer

Needs within the wide potential scope of home economics "There is evidence of need for occupational training programs in home economics in several areas of employment within our community. Potential employers and employees both have indicated a need for training which has been thus far lacking. Students not planning to attend college show concern for their lack of preparation for employment upon graduation."

Needs within one occupational cluster "Our specific needs within major occupational clusters number two rather than one. Both are vital to the future welfare of our community. However, the problem of narrowing the number of clusters is relatively out of our hands. An impending shortage of classroom space due to an ever increasing school system, an occupational cluster involving child care services at the nursery school level must be projected into the future. If space were available, this would be a program of real significance to our community. Therefore, our most practical means of contribution at this time is through the health services, specifically nurse's aide training."

Menominee

Needs within the wide potential scope of home economics "This whole problem area probably is the one which most sharply brings to focus the question of whether the disciplinary approach to all of vocational education is our major handicap. My acquaintance with this particular program is limited to having read the objectives and a few of the topic outlines, so I am not certain that this major stumbling block was not excluded from consideration. It will have to be dealt with though in more effective fashion soon."

Needs within one occupational cluster "Last fall, as other evening classes opened, a 25 hour re-employment laboratory experience in waitressing was advertised and offered. Unfortunately, only two potential students appeared, so the value of the planned experience couldn't be tested. A poll of restaurant managers prior to registration produced mixed, but predominately indifferent reactions. They reacted the same way toward questions about chefs and other kitchen help. (A poll of the several nursing homes and hospitals in the area turned out about the same.) Yet the education committee of the Chamber of Commerce is continually expressing conviction that there are critical shortages in these occupations."

Muskegon

Needs within the wide potential scope of home economics "In October, H. Funk and R. Ingalls (two home economics teachers on the team) visited the local MESC office. We had a wonderful visit and found that the heads were very interested in the training that home economics was considering. They told us that if they had the trained people, they could place them. They informed us that they had openings for motel, hotel help, waitresses, cooks' helpers, etc. (Lots of jobs; too little trained help.) This gave Ruth the encouragement to try a second course in wage-earning this second semester."

Petoskey

Needs within the wide potential scope of home economics "The report 'A Study of the Top O' Michigan Area Study' revealed that there were needs in the health occupations and food service industry. A large number of women in the area hold jobs. This points to the need for emphasizing the dual role of women in homemaking and family life and in wage-earning or employment outside the home.

The Home Economics-Related Orientation Class is keeping a year's record (1965-66) of all the 'employment ads' appearing in local papers for women's jobs in this area. We publicize what we are trying to do."

Needs within one occupational cluster "The biggest single need in our area as expressed by MESC and employers seems to be in the field of food service, especially waitress training. Beauty Academy said they had jobs for 26 beauticians if they can find them to train."

Pontiac

Needs within the wide potential scope of home economics This has not been done. This type of study needs to be done.

Needs within one occupational cluster Food Service needs were established by a survey in June of 1964. Out of 172 employers, 18 responded, that they would need people to fill 221 jobs in the year 1964-65.

At the October P. T. A. meeting of Central High School parents, the helping teacher mentioned the possibility of a Homemaker Service program. One mother called me later to say she felt it was an excellent idea and she

would be willing to take a girl to train on the job. She, herself, had lived with a family while attending college and had found some of her attitudes and ideas regarding family life changing as a result of the experience. A school librarian, when told of the Homemaker Service idea recommended a homemaker she knew who would be well qualified to train students.

An objective type survey instrument has not yet been used to determine needs in the Homemaker Service area."

Wayne

Needs within the wide potential scope of home economics "Basic needs are currently being determined from national, state, and surrounding local informational surveys on the topic. The Wayne Community School District has not made any local surveys regarding home economics occupational needs."

Needs within one occupational cluster "Same as above. Local businessmen have been contacted informally and they have expressed an interest in a food service program. Within the next month, local businessmen will be contacted to serve on an occupational committee for the area of food services."

Wyandotte

Needs within the wide potential scope of home economics "There has been difficulty in securing evidence of need due to our inability to classify jobs using home economics knowledges and skills that we felt would be acceptable to MESC. However, at the present time, an instrument is in the final stage and will be presented to MESC for their reactions and recommendations. They have been contacted and they have offered to furnish us with information of the employment opportunities in:

1. Jobs Requiring Sewing Skills and Knowledges
2. Dry Cleaning and Laundry Establishments Requiring Selected Skills and Knowledges
3. Jobs Requiring Sales Knowledges and Skills and Knowledges about the Product (Ready-to-Wear Clothing, Home Furnishings, etc.)
4. Jobs Requiring Skills and Knowledges in Food Services
5. Resident and Day Care of Children and Youth
6. Nursing Homes, Convalescent Homes, and Homes for the Elderly.

After this has been completed individual business establishments, nursing homes and other employer groups in the Downriver Area will be sent appropriate questionnaires. Information will be sought to determine (1) the employment opportunities in the various occupations; (2) the occupations in which employers have the greatest difficulty in securing qualified employees; (3) the occupations in which the employees have the greatest difficulty in meeting promotion standards or requirements; (4) opinions of employers as to the occupations in which public school training should be offered now and in the future; and (5) willingness of employers to help if a training program would be established.

Involving and Participation of Community Groups and Advisory Committees in the Development of Occupational Training Programs

An effort was made to determine whether or not community groups and advisory committees were being used in the development of occupational training programs in the various vocational services including home economics. There was some evidence of difficulty in interpretation of the question. However below are some of the excerpts from the local reports.

Alpena "No attempt has been made in home economics occupational training programs except a 5 week waitress training unit in Home Economics III."

Gaylord "In 1963, a committee (non-school personnel) was set up to investigate the needs of the community. Questionnaires were sent to businesses and results were compiled by the Committee."

Grand Rapids "We have worked very successfully with the advisory committee in establishing the curriculum and we are now in the process of determining places for co-op training. This is true for both Commercial Foods and Nursery School assistants (Junior College level). Work was done as a total group and sometimes with just one or two members on a certain phase.

Active participation in the Food Executive's Association and Dietetic Association has been a means of making our program known, and in every case, very fine cooperation has been forthcoming from the members."

Lapeer "An occupational training program established in the home economics field would be the first of its kind in this area.

Personal contact with possibly interested potential employers within the community and with the administrative persons in our school system has been the primary source of involving the community.

Opinions of students within existing home economics classes toward such a program were also solicited. Response from these students was very encouraging.

A meeting of the entire group of potential employers, school officials, and resource persons was set up and later cancelled due to a previous engagement of a major portion of the group. It was decided to hold two separate meetings with the two groups of potential employers. (These meetings were held.)"

Menominee "Student machinists and student printers are the only people of any age who are presently enjoying the benefits of community groups and advisory committee participation to a noticeable extent in development of their schooling. This had been achieved by many continuous years of interaction of these influences with career T and I teachers and the graduates of their courses. A more responsive means of development is needed but there evidently are more obstacles to them than I have had time to inventory."

Muskegon

Petoskey "Advisory Committees have been formed for the various vocational courses in each of the departments including home economics. These advisory committees have had strong influences, especially on equipment needed. Employers have indicated that they are very willing to attend meetings.

Many community groups have been involved in the development of the Home Economics Related course (Orientation course). Speakers in H.E.R. class have included:

Mr. McNabb, Director of Social Security
Mr. McAlvey, Local Director of Vocational Education
Mr. Buckmaster, Co-Op Coordinator
Mr. Potter, Administrator of the soon to open County Extended Medical Care Center
Mrs. Johnson, Director of Nursing Program, Community College"

"Opportunities through field trips assisted in interpretation of home economics. Field visits were made to:

Michigan Employment Security Commission
Boyne Highlands - recreational resort
Petoskey Beauty Academy
Little Traverse Hospital
Hooker's Laundry and Dry Cleaners"

Pontiac "An advisory committee for Food Service was organized in May of 1965. The group met twice last year and commented on the curriculum presently being taught. A co-op program was discussed. The group has not met this year."

Wayne "The Wayne Community School District has been fortunate to have the services of a Citizens' Advisory Committee on Vocational Education for over two years. The committee has been very active and helpful in determining the vocational needs of the district."

"The Wayne Community School District is now in the process of organizing its first occupational committee in the area of food services. This committee will assist teachers and administrators in developing a curriculum for the area of occupational food services."

Wyandotte

Planning and Administering the Co-op Program as it Relates to Home Economics Occupational Training

The Co-Op Program related to home economics had not been developed to any great extent in the participating schools. Below are some excerpts from four of the communities as of February 1966. However considerable progress has been made since the above date.

Grand Rapids "We are just in the process of setting up these programs for next year. We are at present contacting businesses which will cooperate in our program."

Petoskey "For many years the Co-Op program has been an integral part of a continuing vocational education program in Petoskey. The position of coordinator has been established and staffed in Petoskey for over thirty years.

Four home economics students have been placed on the Co-Op program:

1. One member of the H.E.R. class (Home Economics Related - an occupational orientation course - for 12th grade students this year) has been placed on the Co-Op program in her family's coffee shop.
2. Another girl (4th year home economics student) was placed in layout photographic work with the local newspaper.
3. Another girl who seemed a misfit in our academically-oriented school program used her interview training technique in the H.E.R. class to get a job at the local drive-in. There has been a noticable change in her attitude toward school.
4. Another girl (over 18 years old) low in I.Q. had tried assembly line work at the local factory. She was encouraged through counseling in the H.E.R. class to seek employment at the local Geriatric Center. She obtained a job 15 hours a week and is very happy in the work. She seems to have real empathy for her elderly charges."

Pontiac "In discussion with the building administrators and Miss France, (the Food Service Teacher) it was decided that:

1. Food Service Co-Op should be offered only to those students who have completed two semesters in Pontiac Central's program and who have been recommended by Miss France.
2. Students should be placed in jobs where employers have the best interests of the student at heart, rather than a source of cheap labor.
3. On-the-job training should provide either:
   - a chance to further explore various phases of the food service industry
   - or a chance to specialize in one area of interest, should the student feel ready for this.

So far, the one co-op student we have this semester (Fall 1965-66) is doing well. He is placed in an excellent training station Pontiac General Hospital Dietary Department. The Home Economics Helping Teacher (Miss Carol Irish) is doing the coordination from the school."

Wayne "No serious problems are anticipated with regard to adding home economics activities to the existing cooperative occupational training program. The planned program in food services will be incorporated into the existing cooperative occupational training program."

## Planning and Developing the Total Home Economics-Related Occupational Curricula

The comments from local teams about their successes and difficulties have been organized with their comments about assistance needed. In general the comments fall into a number of categories chief among them focusing on

(1) the time to prepare curriculum materials and specific problems of curriculum development; (2) staffing programs; (3) school-wide scheduling; (4) facilities, space and equipment; (5) interpretation of the program to students, parents and others especially through brochures or materials.

Alpena

Gaylord "One of the biggest difficulties in the secondary school program is space and required equipment. Also, the addition of extra staff."

Grand Rapids "In the secondary school program it is extremely difficult to establish new courses. The emphasis on wage-earning classes has helped set the stage and administrators see the need. Difficulties are: (1) timing-class selections are made early in the year; and (2) lack of teacher time to write curriculum; (3) lack of facility; and (4) lack of available teachers."

Lapeer "We feel that there is a definite need for occupational training, as well as for the established home economics programs. Thus far, we have been relatively successful in making progress in incorporating the new program into school and community life.

Our difficulties thus far include agreement on a definite job analysis for curriculum development. We are also trying to establish the number of credits for students enrolled in the program. Other classes required for graduation will be worked into schedules of those involved.

Work experience will be provided by the two major hospitals in our area in proportion to the relative size of their establishments.

Post high school people are also eligible for this program, if they wish to participate."

Menominee At the secondary, post-high school and adult levels, "the primary problem has been lack of action on the part of people who can do something about curriculum development. The secondary problem has been lack of direction. This, of course, would quickly become the primary problem if action became commonplace."

Assistance Desired

"Refer me to the best single document among the mass of materials I have relating to the project which defines the scope of 'home economics' in the entire spectrum of wage earning occupations.

Please outline for me the in-service opportunities for a home economics teacher from Menominee for the spring and summer of '66.

If there is any appreciable outside support, either in cash or in kind, in addition to the regular vocational division allowance for conference travel, I should like to know about it.

Under what circumstances (and through what mechanism) may the local administration claim 88-210 etc. funds for expenses in pursuing the objectives of this project."

Muskegon "Is anything being done in other schools on pre-employment in the ninth grade? If so, what? What visual, course content, etc, are included?"

Petoskey "The home economics curriculum at the senior high school level at Petoskey is now organized in specialized areas instead of general courses in homemaking. This will facilitate offering advanced courses and no doubt occupational courses.

In the Petoskey drop-out program we are bringing 'drop-outs' back to school. We are helping the drop-outs to continue their education and to work toward graduation and at the same time giving them Co-Op training.

Assistance desired

(1) "How to set up criteria for selection of students for vocational courses;
(2) A brochure (popular appeal) to publicize program to prospective students and parents;
(3) A study of the proposed '66 curriculum as to how it fits the needs of students in our area;
(4) Critical evaluation of H.E.R. class as a step toward making progress in following year's program;
(5) Formation of an evaluating device to give H.E.R. students in lieu of the expected final examination."

Pontiac "There have been few problems, I feel, in planning and developing Pontiac Central's program. The basic structure works for us. Many teachers would like "The Wigwam" open all week. Present space limits expansion of the program. Funds for equipment have been adequate. Support of the program by administration is excellent.

No related subjects have been planned to coincide with the Food Service program. Although a Reading Specialist mentioned this possibility to me. I would like to see greater correlation with English, Mathematics and Business.

Second year students pose a problem. If some kind of course with a management emphasis could be worked out, this would be good."

Assistance desired

(1) "Girls at Pontiac Central think little of the future. When asked what they'll do upon graduation, they have no ideas. I would like to participate in a brainstorming or discussion sessions on how to stimulate them to think about the future. Maybe an exploratory careers club for 11-12th grade girls would be one answer. I'm sure they're not aware of all the possibilities opening up to them.
(2) I would like to see some sample surveys determining community needs.
(3) I would like to have a workshop on promoting wage earning programs in home economics (particularly, reaching parents and students). Related to this, I would like to develop a home service program. Pontiac schools could use a homemaker service program, but we've not yet thought of a way to overcome the lack of prestige of the occupation. Attitudes of students and parents and other adults would warrant a carefully planned approach.
(4) How to develop second year courses, perhaps leaning towards the managerial level.
(5) Development of objective evaluation devices for wage earning programs."

Wayne "In the secondary school program the establishment of longer periods for instruction creates some problem in departments and school-wide scheduling. Also, some difficulty has been experienced with regard to available time for teacher planning in the curriculum development. It is hoped that a two-week summer workshop will be provided for the home economics curriculum committee. This will allow teachers ample planning time for developing the program which will begin in September, 1966."

Assistance desired

"Beginning in March when the Wayne Community School District's occupational committee on food services begins planning the curriculum, it would be helpful to have resource people available, qualified in the area of food services. These resource people could be drawn from both business and education.

Assistance is needed in designing a survey instrument to more accurately determine the occupational needs in the area of food services."

"There is need to establish introductory experiences at the ninth grade level. The clinical session to be held in May could be very helpful in establishing criteria for such a program.

There is also need to create material which would inform students about the occupational opportunities in areas of food services.

Total programs could be developed with regard to related subjects such as English, Mathematics and Social Studies."

Wyandotte "Our biggest problem is lack of time in our daily schedule to work on curricula and to study the materials that are available for study. People with whom we have talked - teachers, administrators, businessmen and women have all shown an interest in such a program."

Assistance desired

"We need help in developing a home economics occupational orientation course. We will also need help in the interpretation of the findings from information furnished as by MESC and from the questionnaire returned from the various business establishments, nursing homes, etc."

## Description of the Home Economics-Related Occupational Programs in the Participating Communities

### An Overview of Program Development in the Ten Communities

The ten communities participating in the project are currently in a dynamic, responsive and flexible state with many potential changes or developments in occupational education related to home economics. In 1965-66 six of the ten communities offered some type of home economics-related occupational education. In one community, Grand Rapids, occupational

courses were offered for post-high school youth and adults at the Grand Rapids Junior College and for in-school youth in two senior high schools. In five communities, Lapeer, Muskegon, Petoskey, Pontiac and Wayne one or more courses were offered at the secondary school level. Four communities- Alpena, Gaylord, Menominee, and Wyandotte are involved in initial stages of planning and decision making. Alpena offered a unit in waitress training as a part of Home Economics III but did not offer a course.

Tables 4 and 5 (pages 50-52) summarize certain details about the home economics-related occupational courses offered in the six communities in which programs had been launched. Data relating to these courses were secured from written reports submitted by the local teams and where necessary through conferences.

Descriptions of the programs in each of the ten communities are included in a special report.[1]

# CHAPTER V

## DESCRIPTION OF PHASE 5 OF THE PROJECT

This chapter includes descriptions of what was theoretically planned and implemented in Phase 5 of the project. Phase 5 theoretically would focus on (1) follow-up and evaluation including visits to local schools; (2) preparation of written reports and publications; (3) final evaluation of the project by the participants in the project and by a panel of specialists.

### Theoretical Plans for Phase 5

#### Evaluation as an integral part of the project

Descriptive and measurement data regarding procedures and outcomes in relation to objectives of the project would be systematically secured as an integral part of the project. Along with the collection of those data there would be analyses, interpretation, and assessment including recommendations. These data would be used throughout the project in improving processes and programs.

Appropriate measurement and evaluation instruments and methods will be developed and used for each of the five phases of the project and in relation to each of the major objectives of the project. All key personnel involved in the project will participate at appropriate times in evaluation processes.

In general, measurement and evaluation data will be secured through:

(1) logs of activities
(2) written reports
(3) questionnaires, check lists or focused interviews, and
(4) field visits to schools

#### Evaluation of procedures used within each community

Evaluation will focus on appraisal within each community of the effectiveness of the procedures used and the outcomes resulting from local effort and decisions. Such evaluation and appraisal would culminate in a written report which could be made available to others. It might also include (1) a series of slides and a manual which would show the development of the program or parts of the program or (2) one or more tape recordings in which pertinent problems or questions were raised and discussion of how these were dealt with in the local community.

Evaluation of roles played by leadership groups in the various phases of the project

Appraisal would be made within each community of the effectiveness of the roles played by leadership groups including specialists, consultants, director of the project or others who participated in the institutional workshop, clinical sessions and/or in the local community setting.

Synthesis of findings from local teams and consultants

Final evaluation of the project would be an effort to synthesize the findings from local school-community teams and from consultants. Answers to certain questions indicated below in Methods of Analysis would be explored.

Some questions

1. What are the promising or effective procedures for establishment of needs for training programs in occupations related to home economics? From the point of view of local schools which procedures seem most valid and feasible and which ones were used?

   What are the values or limitations of certain recommended procedures? What questions were raised and need further study?

2. What constitutes evidence of needs for occupational training programs related to home economics in local communities? For which groups? For which occupations?

   What evidence did local schools present and what conclusions did they draw about needs for occupational training in home economics?

   What questions were raised about the adequacy of evidence and about the priority of needs?

3. What are effective methods of involvement of school and community groups in discussion of needs which have been identified and some possible patterns for training programs?

   From the point of view of local schools which methods of involvement seemed most valid and feasible? Which methods were used? What questions were raised and need further study?

4. What is the potential teacher supply in local schools and communities and what training needs seem evident to provide and safeguard an adequate supply of trained personnel for occupational training programs related to home economics?

   What procedures did local schools use to determine the potential teacher supply? What training needs were evident? What proposals or plans for training of potential teachers were made? What types of assistance would local schools like in

preparation of an adequate supply of well qualified teachers for the occupational training program?

5. What are promising patterns for occupational training programs related to home economics? From the point of view of local schools, which of the patterns for training programs have high acceptance in terms of validity, feasibility and resources available? Which have low acceptance?

   What are the reasons given by local schools for high acceptance of certain patterns for training programs and for low acceptance of others? What questions were raised which need further study?

## Final Evaluation of the Project

A panel of specialists including leadership at national and state levels will participate in making value judgments in interpretation of the findings with special reference to the following three questions:

1. What were the problems of local schools and communities in planning and implementing occupational training programs related to home economics?

2. What recommendations appear to be justified or supported in view of the findings:

   a. for local schools and communities

   b. for institutions of higher education

   c. for leadership in the State Department of Public Instruction

3. Was the "cooperative approach of teacher education, leadership in the State Department of Public Instruction and local communities" effective in the initiation, planning, implementation and evaluation of occupational training programs related to home economics? What were the strengths and weaknesses of the approach?

## Implementation Steps in Phase 5

### Visits to Local Communities, Fall 1966

Visits were made to participating communities in October, 1966. The major purposes of these visits were: (1) to follow-up the Clinical Sessions (Phase 4); (2) to discuss publications or reports which would be prepared as a part of the project; (3) to make plans for a summary and evaluation of procedures which had been used in processes of establishment of home economics related occupational education.

There were very favorable reactions to the Clinical Sessions. The local teams felt that the reports which had been presented by the participating communities had been very interesting and helpful.

During the visits to the communities it was pointed out that the major purposes of the project were to build experience, validate procedures and share experiences and materials with others. The project as a method was selected because it had a high learning potential for all participants and a high potential for applicability to other situations.

The local teams reacted favorably to the four types of bulletins or publications which would be prepared as a part of the project. Each of the teams from the participating communities expressed willingness to contribute a description of its own program for one of the bulletins. Local communities preferred to be free to describe their own programs without the use of a common format. The descriptive reports from local communities would include photographs illustrating aspects of their programs. Local reports would be forwarded as early as possible in the fall, 1966.

The theory of social action had been accepted as an important framework for establishing home economics occupational programs. The framework had been presented at the workshop (phase 2). Specific materials describing the social action model and its application to establishment of home economics wage-earning programs had been made available to local teams through a special publication.

A tentative evaluation form or check list based on the social action phases was discussed and distributed to local teams. Specifically the purposes of the check list were: (1) to determine the extent to which participants believed that the twelve phases in the social action model are important in establishment of occupational programs related to home economics; (2) to determine the extent to which participants believed each of the phases had been used in their local communities; and (3) to secure reactions to the instrument itself.

To assist local teams in the evaluation process some study questions had been prepared for each of the social action phases. If a community had launched an occupational course, a complete set of study questions was left. If a community were only in initial stages of planning, study questions to phases I-V were left. It was pointed out that the study questions might assist in recalling procedures used and in sharpening the evaluations.

A copy of the revision of the evaluation form is included in the Appendix as illustrative material. It is essentially the same as the original but greatly shortened in the number of pages.

Local teams agreed to forward their evaluations as early as possible in the fall, 1966.

## Preparation of Publications and Reports

Two publications were prepared in the fall 1966 to assist with the problems experienced at state and local levels in the interpretation of the

total scope of home economics in occupational programs. These were:

Descriptions of Home and Community Occupations Related to Home Economics

Worker Requirements and Methods of Entry into Home and Community Occupations Related to Home Economics

The reports were regarded as tentative but as a step in the direction of interpretation of the total scope of home economics. In the preface of the publications care was taken to avoid the misunderstanding that the diciplinary approach would be used in home economics-related occupational education. The following excerpt clarifies the position taken with reference to the vocational education services:

> Some of the occupations listed are the concerns of one or more services in vocational education, including agricultural education, business education, distributive education, home economics education, trade and industrial education and health occupations. The extent and nature of involvement and the unique contributions of the various services within vocational education are matters for continued study or consideration as occupational education becomes increasingly characterized by joint or cooperative effort at state and local levels.

The relation of home economics occupational education to certain other professional groups was also made clear in the preface of the reports:

> Some of the occupations listed in Family, Child Care, Care of the Elderly, and Health Services are obviously the major concerns of the professions of nursing, public health and social service. These occupations are included in this bulletin for several reasons: (1) home economists and others on the reaction panels indicated that they believed these occupations were 'home economics-related'; (2) these occupations are of increasing importance to individuals and families in our society and there are serious shortages of trained personnel at all educational levels; and (3) home economists have deep commitments to support joint efforts in occupational education involving the provision of these much needed services.

Two other publications were tentatively prepared for review by the advisory committee, local teams from the participating communities and the evaluation panels. The publications were:

Ten Michigan Communities Report on Establishing Wage-Earning Programs Related to Home Economics

Procedures for Establishment and Evaluation of Training Programs for Wage-Earning Occupations Related to Home Economics

## Visits to Participating Communities, May 1967

Visits were made in May 1967 to the participating communities to discuss the status of the project and to finalize it. The two completed

bulletins were discussed. Local teams indicated the number of copies which they wished for local use and distribution. These were left.

Local teams were enthusiatic about the two completed publications. They believed the reports would have broad uses in their local programs and that they filled a very great need.

Local teams reviewed the tentative copies of the two additional bulletins: (1) "Ten Michigan Communities Report on Establishing Wage-Earning Programs Related to Home Economics" and (2) "Procedures for Establishment and Evaluation of Training Programs for Wage-Earning Occupations Related to Home Economics." Local teams assisted in making editorial and/or other changes in the reports relating to their own programs. They were willing to have their communities identified in the research report.

The question was asked: "Based on your experience in establishing occupational courses related to home economics, what recommendations and suggestions do you believe would be especially helpful to local communities?" The local teams were very thoughtful and generous in sharing what they had learned. Their suggestions and recommendations will be incorporated with those made by the evaluation panels and the advisory committee in the two above reports.

Reactions to the project from local teams were sought through three types of questions: (1) What is your general reaction to the project as a way of working? (2) What, if anything, have you gained from participation in the project? What are some of the challenges ahead as home economics, the newest field in occupational education, tries to make its contribution?

The reactions to the project as a way of working were favorable. Local teams expressed the need for assistance from the colleges and universities and the State Department of Education as they continue to develop their local occupational education programs. Some of the comments included;

> The project as a way of working is a major step forward in the area of curriculum development.
>
> The project publications offer something specific and provide much needed resource materials which can be used locally.
>
> The Clinical Sessions provided personal gains through sharing of stories of progress told by the representatives from other communities.
>
> The project publications are terrific. They are just what we needed. Other vocational services should do the same.
>
> Within vocational education home economics needs to meet the challenge of expanding the occupational program. This may not be easy. It needs the support of all groups.
>
> The Workshop helped in getting oriented to the tasks ahead. The atmosphere was friendly and supportive. The many consultants were experienced and knew what they were talking about.

The local teams were extremely busy persons. Throughout the project they patiently adjusted their programs to participate effectively in the project. They reacted constructively and creatively within the framework of the project. They were open minded and viewed occupational education related to home economics as a long time and worthwhile objective. They realized that they were "just beginning." While some had not been able to make the progress anticipated, occupational education related to home economics was still an open question and a real challenge.

## Project Evaluation Panels

At a meeting of the advisory committee in April 1967, a general plan for evaluation of the project was discussed. Adequate funds were not available for an evaluation of the project by state and national leaders of vocational education as indicated in the research proposal. However an alternative plan seemed to be more appropriate considering the exploratory nature of the project.

Two universities, Wayne State University and Western Michigan University had demonstrated interests in occupational programs related to home economics. During 1965-67 special workshops and courses had been offered at these institutions to assist teachers in becoming more knowledgeable about and competent in such programs. Assistance in evaluation of the project from these two institutions seemed especially appropriate. The administrative heads, Dr. Eunice Herald, Western Michigan University and Mrs. Bette LaChapelle, Wayne State University agreed to serve as chairman of the evaluation panels in their own institution.

Dr. Herald and Mrs. LaChapelle extended invitations to panel members in their own institutions. They agreed upon the date, place and time of the meeting. The conferences were held at Western Michigan University on May 15 and at Wayne State University, May 17.

In preparation for the conference, sets of materials describing the project were delivered to each chairman for local distribution and study prior to each meeting. The sets included: (1) copies of the research proposal: (2) copies of the two completed bulletins describing home and community occupations related to home economics; (3) the two tentative reports describing the programs in the ten participating communities and the project itself; (4) some study questions for use in synthesizing the findings and for discussion at the evaluation conferences.

In the practical process of synthesis of the findings, the panels of specialists were asked to focus on three types of questions for each of three categories.

The common questions were:

1. What are the findings? How are these interpreted by the panel members?

2. What suggestions and/or recommendations seem appropriate which would be of value to others involved with wage-earning educational programs?

3. What questions have been raised which need further consideration?

Three areas included:

1. Processes, procedures, steps, methods of approach used.

2. Characteristics of local programs developed, courses, work experiences, groups served, supervisors, vocational directors, staff and teachers, facilities, follow-up, etc.

3. Leadership - Readiness and availability of staff and teachers.

Another area for consideration by the panel of specialists focused on the project itself. What was actually accomplished? What did the participants feel they gained? Was the cooperative approach productive? What were its strengths and weaknesses?

## Synthesis of the Findings, Evaluation and Appraisal

At the beginning of the project professional groups at state and local levels were uneasy and needed to become more knowledgeable about and experienced in the establishment of home economics-related occupational programs. The method of the local-school community as a laboratory combined with institutional workshops and clinical sessions was selected because of its (1) high potential for learning for everyone especially for leaders in vocational education and its (2) high potential for applicability to other situations. These underlying purposes have been kept in mind in the synthesis of the findings, evaluation and appraisal.

The project was exploratory and relatively short termed. Few individuals actually participated in all phases of the project. However, a small but important continuing group participated in various capacities and brought or helped to maintain a sense of continuity. There were changes in personnel in the participating communities including new superintendents, principals, directors of vocational education and home economics teachers.

In the synthesis of the findings and the appraisal, answers to four types of questions were sought:

1. Who were the professional groups who participated in the project?

2. Which procedures were used in the establishment and evaluation of home economics-related occupational programs? What types of programs were launched? What problems if any were encountered?

3. What did the participants at local and state levels learn through their experiences?

What suggestions and recommendations did they believe would be helpful to others?

4. What were the strengths and weaknesses of the project?

## Professional Groups Involved in the Project

Over the two year period 1965-67, 53 professional leaders in the ten participating communities and 35 professional leaders at the state level participated in one or more phases of the project.

At the local level the distribution was as follows:

20 superintendents, principals, assistant principals

11 directors of vocational education, coordinators, counselors

22 home economics teachers, supervisors, heads of home economics departments or helping teachers

At the state level the distribution was as follows:

13 specialists in vocational education other than home economics education

18 specialists in home economics education

4 home economists

## Procedures Used

Theoretically the procedures which have been recommended by Reinwald[1] and Schnell and Mills[2] were generally accepted by the participants. The phases of model for social action also were regarded as useful in processes of innovating home economics occupational programs. The evaluation panels summarized the processes or procedures which were used in local communities as follows:

1. Processes, procedures and method of approach seemed to differ somewhat from one community to another

2. Schools or communities functioned at different rates of time in establishing wage-earning programs in home economics

3. Some communities were methodical and well organized before beginning or offering programs. These schools seemed to have a grasp of their long and short range goals

---

[1]Cleo Reinwald, "Education for Employment," Bulletin of National Association of Secondary School Principals, Vol. 48 (December, 1964), p. 30.

[2]Dorothy M. Schnell and Jane Y. Mills, "Education for Gainful Occupations Related to Home Economics--In California," Illinois Teacher of Home Economics, Vol. VIII, No. 4, p. 171.

4. The communities which took time to pre-plan involved six steps:

established advisory committees
established a need for a specific cluster and/or clusters of occupations within the community
involved the school administration, vocational directors, coordinators, counselors, staff and home economics personnel
publicized the new dimension of the home economics program to different school and community groups
worked cooperatively with the established co-op program within the school
developed wage-earning occupational programs for different grade levels

The following summarizes the number of the ten communities which used the above procedures:

| | |
|---|---|
| Established advisory committees | 6 |
| Established need for a specific cluster or clusters of occupations | 9 |
| Involved school administrators, directors of vocational education, coordinators and home economics personnel | 10 |
| Publicized the new dimension of the home economics program to different school and community groups | 8 |
| Worked cooperatively with the established co-op program within the school | 5 |
| Developed wage-earning occupational programs for different grade levels | 6 |

The extent to which local groups used the model for social action is less well understood. The model for social action prescribes a sequential process by which a person or group of persons might implement or establish a new program into usage in a local community. This particular model has been successfully tested in several Michigan communities to implement adoption of various types of programs. The twelve steps or phases of this model for social action covers the complete process of action from inception of an idea to adoption of its use in a specific way for a particular social system or community. The use of the social action model was emphasized in the Workshop.

A comprehensive evaluation instrument and study questions were prepared to determine the degree of acceptance of the twelve phases and the extent each had been used in the local communities. These materials were distributed in the fall, 1966 but after repeated efforts only a few were returned. An abbreviated description of the phases is included in the Appendix.

Characteristics of the Programs Which Were Launched

Occupational programs were established in six of the ten communities. In three of the communities, programs had already been launched or were in initial stages of being planned at the time the schools accepted the invitation to participate in the project. New programs were launched during the project in three additional communities. Programs were not established in four communities but in these communities it was anticipated that programs might later be developed if facilities, staff and released time could be made available.

The following briefly summarizes the general characteristics of the courses offered and groups served:

1. Three communities had made attempts to provide some occupational orientation experiences in their programs. Occupational orientation was offered as a semester course, a year course, or a unit. Total enrollment was approximately 300. The age levels ranged from the junior high to the 12th grade level.

2. Courses in food service and hospitality education were offered at the 10th --- 12th grade levels in five communities. The total enrollment was approximately 400.

3. A one year nurse aide course was offered in one community with an enrollment of 19 students at the 12th grade level.

4. A semester course in general wage-earning related to home economics had been offered in one community for two consecutive years. The course was offered for 10th-12th grade students. Approximately 60 students had been enrolled.

5. A small number of students had been enrolled in the Co-op program but plans for development of this program were in progress.

6. In one community five food service courses for adults had been offered for purposes of up-grading the industry. These courses had been offered at the local junior college, with a total enrollment of approximately 90. A course in commercial clothing was also offered with an enrollment of 12.

Areas of General Learning and Problems

All participants in the local communities and at the state level had a reasonably adequate understanding of the reasons why the occupational preparation role in home economics needed to be assumed. They had certain functional understandings of the bases upon which occupational programs in general need to be built. They had difficulty in identifying the scope of home economics in occupational education and identifying specific home

economics-related occupations. They grew in their interest in, sensitivity to and understanding of the future possibilities of home economics-related occupational programs.

Home economics representatives at local and state levels became increasingly confident and competent in assuming their new roles in wage-earning programs. This was true for those home economics personnel who had participated in establishing one or more occupational courses. There continued to be a hesitancy and uneasiness on the part of home economics teachers in those communities in which programs were not established.

Home economics personnel appeared to be working closely with the school administrators, directors of vocational education and others and strongly supported the team approach. Generally, the directors of vocational education assisted in providing support and "know-how" in the actual development of occupational programs related to home economics.

Problem were experienced in the following areas: (1) interpretation of home economics; (2) equipment and facilities; (3) time for courses; (4) qualified teachers; (5) curriculum development; and (6) valid studies of employment opportunities in home economics-related occupations. Little progress had been made in evaluation although some follow-up had been made of students who had completed specific courses.

## Suggestions and Recommendations for Future Development

The teams from the participating communities, advisory committee and evaluation panel members assisted in making some suggestions and recommendations which would be useful to others in establishing home economics-related wage-earning programs. These have been described in another report prepared for local use; limited excerpts of the report are included below.[1]

1. Need for Administration Support

   Potential programs in occupational preparation have greater chances for successful launching and implementation if school administrators give adequate support from the beginning. While there is evidence that school administrators believe that the major role of home economics is education for homemaking and family life, many see that home economics also has a responsibility and an important contribution to make in wage-earning preparation.

   Financial support, delegation of responsibility, released time or flexible schedules, and accountability for action appeared to affect the actual launching of programs.

[1]Beatrice O'Donnell, Ten Michigan Communities Report on Establishing Wage-Earning Programs Related to Home Economics College of Education, Michigan State University, 1967.

2. Allow Adequate Time For Planning and Launch The Program Experimentally the First Year

The teams from the participating communities agreed that "timing" and the need for adequate time for planning were areas in which major lessons had been learned. They questioned crash programs in which plans are expedient or hastily made and implemented. They strongly supported the need for some released time and a flexible schedule for the person(s) responsible for program development. They specifically suggested one and a half to two years for the planning phase.

3. Build A New Type Of Team Approach Within The School

Close cooperation within vocational education is important but it is not enough! There was consensus that a genuine school team approach would be a productive, effective and rewarding method of working in establishment and evaluation of an occupational program. While representation on the teams might vary, theoretically there should be as broad a representation as feasible including administrators, counselors, academic faculty and all vocational services.

Some felt that the home economics teacher or supervisor might need to be the impetus to get such a team appointed, organized and underway. Others felt that the director of vocational education or the coordinator would be in a more favorable position to do this. Such a group was referred to as an In-House Advisory Committee.

4. Have Several Kinds of Advisory Committees

Teams from the participating communities and vocational specialists recognized the need for several kinds of advisory groups who would have quite different functions. Need was expressed for an advisory or citizens group for vocational education; an advisory group for occupational programs in home economics and a special advisory group for occupational preparation in the specific clusters in which programs were being established.

5. Be Imaginative In Providing For Space, Facilities and Equipment For New Courses or Programs

With an imaginative teacher and some additional funds, regular homemaking laboratories or facilities can be effectively adapted for use in many types of beginning occupational courses. Facilities and equipment for advanced courses usually are provided in a special school or in an area vocational-technical school whereby students are bussed to the central school especially equipped for specific curricula. Cooperative occupational programs provide realistic on-the-job experiences and reduce the necessity or demand for expensive equipment at the secondary level.

Space if not otherwise possible may be made available for occupational courses through adjustments and/or revision of

regular home economics offerings. This can be done with the possibility of enrichment which "livens up a program!

A "bang-up summer occupational program" is another alternative which might be used to provide space in an over-crowded school.

6. Adjust the Load of the Occupational Teacher

One member of the evaluation panel reported that a full load for an occupational teacher consists of one class in the morning and one class in the afternoon working with 40 students. Each class would meet usually for 120-180 minutes. The rest of the day is considered released time for performing the other functions needed in carrying on an occupational program.

7. Need To Be Flexible and Imaginative In Staffing Occupational Programs

The teams from the participating communities emphasized the need for an effective teacher of an occupational course or program. Some simply put it this way: "You have to have the right teacher." Others put it in another way: "The key problem is to get people to train the students."

Home economics teachers are generally not qualified without additional preparation and adequate work experience to teach occupational courses.

Teachers are being encouraged to attend special summer workshops on wage-earning programs, and to enroll in courses offering opportunities for work experiences in specific areas.

The evaluation panels stressed the need for colleges and universities to step-up their programs to provide college credit for work experiences in various clusters related to home economics at both the pre-service and in-service levels. The suggestion was made that work experiences in two areas be built into the curriculum for home economics teachers.

In several of the programs home economics teachers are gradually working into responsibilities of the coordinator. The following suggestions were made:

"Start with the coordinator you already have and gradually get the home economics people trained."

"Encourage home economics teachers to take a course in principles and practices of Co-Operative Education."

8. Need To Interpret On-Going Programs To Students, Parents and Faculty

In the opinion of teams from the participating communities, interpretation of the program to students and to parents should have high priority. Careful interpretation of the program

assists in recruitment and reaching students in need of the program offered. Significant peer groups, parents, counselors, faculty and administrative personnel all directly or indirectly influence actual enrollment in courses.

Interpretation of the program may be and often is most effective when people actually see what is happening to students who are enrolled in the course. For example, in Food Service courses which operate effective tearoom service there is visability of the program and its effectiveness to faculty, students and others who may be guests. Educational and social approval are evident. Students feel this support and experience feelings of confidence and "self-worth" as they become increasingly competent.

The teams from the participating schools and the members from the evaluation panels continuously emphasized the following:

1. "Keep the point of focus on the students."
2. "Remember integration takes place in students."
3. "High-light what is happening to students."

9. Try a Summer Program In Occupational Preparation

One member of the evaluation panel suggested that in their community, when students are looking for jobs and are free to work, it may be a strategic time to have a "bang-up" summer occupational program. Such a program might have several possible advantages. There would be a natual setting for a work-study program; the facilities of the school would be available; the teacher could have a flexible time schedule; it might serve as an opportunity for the teacher to get some experience; it could conceivably be an opportunity to serve as a demonstration program including opportunities for teacher education.

10. Consider a Two-Year "People Centered" Occupational Program

Questions have been raised and discussed about the possibility of a "broad people-centered" occupational program at the high school level, which would be focused on diversified job preparation in child care services, family services, health services and care of the elderly services.

Such an occupational program might have the following broad outline: (1) A semester orientation course available to students in grades 10-12, which would open up the diversity of home and community occupations and employment opportunities in the total cluster as illustrated in two recent publications made available in this Project[1] (2) four, one-semester courses

[1]Beatrice O'Donnell, Descriptions of Home and Community Occupations Related to Home Economics. (East Lansing: Educational Publication Services, College of Education, Michigan State University, 1967).

Beatrice O'Donnell, Worker Requirements and Methods of Entry into Home and Community Occupations Related to Home Economics. (East Lansing: Educational Publication Services, College of Education, Michigan State University, 1967).

of 180 hours each in child care services, family services, health services, and care of the elderly services; (3) diversified work experiences on week ends, after school or in summer programs; (4) a Co-Op course at the 12th grade level for those who meet requirements in the area of greatest competence and interest in employment. Elective courses might be encouraged in home management, advanced homemaking, home nursing, home and family living, advanced foods or advanced clothing.

11. Make Plans For Follow-up, Continuous Evaluation and Program Improvement

A systematic follow-up of students who have completed occupational courses and/or programs is an integral part of occupational programs. Where are the students? What are they doing? How well are they doing? What are the strengths and weaknesses of the occupational program? How can the program be improved? Answers to these questions are important for program evaluation and improvement, for recruitment and interpretation.

## Appraisal of the Project

The project had both strengths and weaknesses.

1. Local teams reacted favorable to the cooperative project. They believed that the idea of cooperative relationships between the local communities, the State Department of Education and Michigan State University had been useful to them and that the findings from the project should have value also to their communities. One administrator indicated that he believed that the project was a real step forward in curriculum development and that other fields might profitably emulate this method. Other administrators indicated their need for looking to the colleges and universities and the State department for continued assistance.

   Local teams were enthusiatic about the two publications identifying home economics-related occupations and describing worker requirements and methods of entry into these occupations. They believed that these publications were excellent resource materials for local use and in their words were "just what we needed."

2. Local teams who had participated in the Workshop and Clinical Sessions believed that the group meetings had been very helpful. They indicated that the presentations of substantive content by the wide variety of highly competent professionals at the Workshop had been very stimulating and helpful. They also believed that the workshop group had been personally very supportive.

3. Five visits were made by the director of the project to the participating communities. In arranging for these visits, purposes were always made clear and alternate dates for the

visits proposed. During the visits, she reviewed progress, listened to discussions, secured reactions and approval for project actions and distributed reports or publications. Sometimes she visited classes. She served as the coordinator of the project and generally did not serve in the usual "consultant role." No study was made of the effectiveness of this role.

4. Three publications were made available through the project. These were prepared as resource materials to assist in program development at state and local levels.

   Descriptions of Home and Community Occupations Related to Home Economics

   Worker Requirements and Methods of Entry into Home and Community Occupations Related to Home Economics

   Ten Michigan Communities Report on Establishing Wage-Earning Programs Related to Home Economics

   Participants in the project have enthusiastically reviewed these publications as needed and timely.

5. The general reaction of the groups at the state and local levels indicate that "a great deal of work" had been done in the project.

6. While the general design of the project seemed appropriate to the purposes many adjustments had to be made in the time schedule. Insufficient time had been allowed for the project as a whole and specifically for Phase 5.

7. Phase 1 was not realistic because seven of the local teams were involved in vocational-technical area studies in which employment opportunities and needs for occupational programs were being determined. Furthermore, the reports of these studies were not generally available for effective local use during the early phases of the project.

8. In Phase 2, (Workshop) about half of the communities participating in the project were represented. In Phase 4 (Clinical Sessions) two communities failed to have representatives.

9. With the exception of the director of the Project, the participants had no released time. Financial assistance through the project to participants of the Workshop and for released time might have accelerated program development.

10. An additional meeting similar to the Clinical Sessions would have been useful for purposes of focusing on curriculum and evaluation and for evaluating the project.

# A PROGRESS REPORT OF HIGH LIGHTS OF ACTIVITIES, EMPHASES, PROCEDURES AND ACHIEVEMENT IN COMMUNITIES PARTICIPATING IN THE PROJECT

Name of school community reporting: _____

Directions: Will you please briefly outline or describe the activities in your school and community which have been directed toward the establishment of home economics related occupational programs. Your responses will be used in a NEWS REPORT which will be sent to the schools participating in the project.

You may wish to disregard this form and write your story in your own way. This indeed would be very satisfactory! The only purpose of the outline is to assist in simplifying your work. Other communities want to know what is happening in your community and only you can tell the story.

Will you please forward your report by February 1, 1966 in the enclosed stamped self-addressed envelope. The extra copy is for your files.

Beatrice O'Donnell, Director of
the Project

Note: The spacing below has been reduced for use in the Appendix.

1. Your attempts, methods, successes and/or difficulties in the following:

   a. in explaining or interpreting the potential scope of occupational training in home economics?

   b. in establishing evidence of need for occupational training in home economics (1) needs within the "wide potential scope" of home economics (2) needs within "one occupational cluster" (Example Food Service)

2. Attempts, methods, successes and difficulties in involvement of community groups and advisory committees in development of the following:

   a. occupational training programs in general

   b. occupational training programs in vocational fields other than home economics

   c. home economics occupational training programs

3. Home economics occupational orientation courses or parts of courses which are being planned and/or offered

   a. Titles of courses now offered  Grade Levels  Number Enrolled

   b. Titles of courses being planned  Grade Levels  Estimated Enrollment

4. Home economics occupational courses or series of courses which are being planned and/or offered at the secondary level

   a. Titles of courses now offered*  Grade Levels  Number Enrolled
      (*Identify Co-Op courses)

   b. Titles of Courses being Planned*  Grade Levels  Estimated Enrollment
      (*Identify Co-Op courses)

5. Home economics occupational courses or parts of courses for adults and out of school youth which are being planned and/or offered at the community college or elsewhere

Community college

| | | |
|---|---|---|
| a. Titles of courses now offered | Type(s) of Groups | Number Enrolled |
| b. Titles of courses being planned | Type(s) of Groups | Estimated Enrollment |

Elsewhere

| | | |
|---|---|---|
| a. Titles of courses now offered | Types of Groups | Number Enrolled |
| b. Titles of courses being planned | Types of Groups | Estimated Enrollment |

6. Please describe attempts, progress, successes and/or difficulties encountered in planning and administering the Co-Op program, as it relates to the home economics occupational training

7. Have you developed any charts or diagrams which show the home economics course offerings as they are now and as you are planning they may be in the near future for both the homemaking-family life program and for the occupational training program?

____Yes ____No (If available please enclose charts or diagrams)

8. Describe successes and difficulties in making decisions, in planning and developing the total home economics occupational curricula, including required courses, related subjects and work experiences for various groups

a. the secondary school program

b. the post high school and community college program

c. program for other groups not included in "a" and "b" above

9. Other activities emphases or achievements in occupational programs related to home economics not included in any of the above

10. Areas, aspects or problems in which you would like some special assistance now and in the near future (prior to May)

11. Areas, aspects or problems recommended for the proposed emphasis at the Clinical Sessions, Michigan State University, (Phase 4 of the Project) - probably in May

MICHIGAN STATE UNIVERSITY EAST LANSING

COLLEGE OF EDUCATION • DEPARTMENT OF SECONDARY EDUCATION AND CURRICULUM

Dear

Local schools and communities in Michigan have encountered certain problems in their attempts to clarify the contribution of home economics in occupational training programs for youth and adults.

A research project is now in progress in which ten communities, the State Department of Education, Vocational Education Division, and Michigan State University are cooperating as a team. The project is entitled: "Procedures for Establishment and Evaluation of Training Programs in Wage-Earning Occupations Related to Home Economics."

Enclosed are some materials to which we would like very much your honest reaction and value judgment. Your responses and those of others will be used as a basis for a report to local schools and communities as they attempt to make effective use of the contribution of home economics to occupational training programs.

We know that you are a very busy person, but we need and appreciate your contribution. May we have your reply by so the reports may be summarized for use by local schools.

For your convenience, a self-addressed stamped envelope is enclosed.

Sincerely yours,

Beatrice O'Donnell, Director
Home Economics Occupational Research Project
Room 215 Erickson Hall

# REACTIONS TO AND USE OF THE SOCIAL ACTION PHASES IN ESTABLISHMENT AND EVALUATION OF OCCUPATIONAL PROGRAMS RELATED TO HOME ECONOMICS

Please use answer sheet which accompanies the description of the twelve social action phases.

---

Description of Phase, Procedure or Step

---

Phase 1. Convergence Step

Two or more persons begin to talk about the need for initiating (and/or expanding) a training program for occupation(s) which use home economics knowledges and skills.

Phase 2. Initiation Step

These two or more persons who recognize the need for home economics occupational training discuss informally the problem with others.

Phase 3. Legitimization Step

These persons attempt and secure reactions, approval or agreement from influential leaders in the school and community that some kind of program in home economics occupational training is needed.

Phase 4. Diffusion Process - (May take place before Phase 1 and throughout the action steps.)

Information is provided to members of the school and community to bring the problem to the attention of influential leaders and others. The purpose of knowledge build-up is to create an awareness of the problem, to arouse interest and to help people to see the challenge and value a home economics occupational training program might have. The purpose would also be to stimulate dialogue and later action.

Phase 5. Definition of Need

The school administration, other staff members, the advisory committee define the need for training in occupations related to home economics.

They use existing agencies and reports. They may make local studies, summarize the findings about job opportunities and persons requiring training; they interpret their findings, come to conclusions or make decisions about the specific nature of the local need or needs.

Phase 6. Set Goals

Immediate and long time goals are formulated. These goals may be formulated by one or more groups within the school and community who would be designated by the school administration.

The goals when formulated are submitted to the superintendent and board of education for approval and/or next steps.

Phase 7. Means

Resources for accomplishing the chosen goals are specifically defined by the school administration, local board of education, advisory committee and others knowledgeable about requirements, standards or criteria for home economics occupational training programs: financial resources; physical resources (classrooms, laboratories, laboratory equipment, supplies, etc.); human resources; teacher(s), coordinators for supervised work experiences, guidance and counseling services or personnel, work experience personnel, placement of trainee.

Phase 8. Plan of Action

Detailed plans will incorporate plans to achieve long range and immediate goals. The plan of action will deal with: preplanning decisions about the curriculum (training program); actual preparation of materials for the program; plans for curriculum implementation; plans for evaluation and improvement; and plans for a sound public relations program.

Phase 9. Mobilization of Resources

School administration, board of education and staff mobilize the resources to put the occupational training program into effect.

Action is taken to mobilize: financial resources; physical resources; human resources; legal agreements with employers who would supervise the work experiences.

Phase 10. Launching Stage:

School administrators and staff take action to implement the home economics occupational training program: (a) set date for offering course(s); (b) publicize information about training course(s) in order to recruit trainees; (c) screen applicants for the training course(s); (d) and select and enroll trainees in the course(s).

Phase 11. Action Step

The plans for the training program are actually carried out as planned and/or adjusted as necessary: (a) the course is offered; (b) the course is taught; (c) the work experience program is supervised; (d) job readiness of trainees is determined; (e) trainees are placed in available jobs; (f) follow-up is made of trainees who have completed program and are employed.

Phase 12. Evaluation Steps

Both process and end product need to be evaluated. Evaluation occurs at each step in the social action process.

As a basis for assessment or evaluation, there is special need for some systematic agreed-upon method of record keeping of trainees on an individual and cumulative basis. (product)

Final evaluation is made at the end of the first training program. It may be done by the school administration, staff, advisory committee or others. It may be done by outside consultants.

*RESEARCH PROPOSALS; *GUIDELINES; *EDUCATIONAL RESEARCH; *VOCATIONAL EDUCATION; *RESEARCH COORDINATING UNITS; PROJECT APPLICATIONS; RESEARCH PROJECTS; RESEARCH NEEDS
BUREAU OF OCCUPATIONAL EDUCATION RESEARCH; NEW YORK

The Bureau of Occupational Education Research of The New York State Education Department is the Research Coordinating Unit (RCU) for New York State. The Bureau is responsible for the promotion, management, evaluation, and dissemination of occupational research under the Vocational Education Act of 1963. Research studies submitted to the Bureau require well-developed proposals dealing with significant educational problems. The format to be used in submitting proposals includes: (1) the cover page, listing the title, sponsor, principal investigator, project approval, duration of project, funds requested, and date of submission, (2) the body of the proposal, stating the problem, objectives, related research, hypotheses, and procedures, (3) the time schedule, (4) personnel by name, title, and educational background and occupational experience, and (5) budget including personnel salaries, travel, supplies, fringe benefits, and miscellaneous costs. Four signed copies of the proposal must be submitted to the Bureau Project Officer. Project budget forms are included for itemizing and summarizing the funds requested under the proposal. (HC)

# GUIDELINES FOR SUBMITTING OCCUPATIONAL RESEARCH AND DEVELOPMENT PROPOSALS

The Bureau of Occupational Education Research of the New York State Education Department has been designated by the United States Office of Education as the Research Coordinating Unit (RCU) for New York State. The Bureau (RCU) is responsible for the promotion, management, evaluation, and dissemination of occupational research under the Vocational Education Act of 1963, Public Law 210 of the 88th Congress. Section 4(a)(6) of the Act provides for funding "ancillary services and activities to assure quality in all vocational education programs." The Section provides the necessary funding for the Bureau of Occupational Education Research.

The Bureau also works closely with the New York State Employment Service of the Labor Department in order to coordinate the employment needs of business and industry with occupational offerings at the secondary and post-secondary levels.

Purposes of the Bureau of Occupational Education Research are as follows:

1. To advise on research design and methodology through expert consultation from professional staff within and outside the Bureau and from colleges and universities.
2. To review and evaluate research findings for credibility, scientific reasoning, reliability, and validity.
3. To disseminate outstanding occupational education research studies.
4. To promote occupational education research, through speaking engagements, guidelines, visitations, and institutes.

These aims are accomplished through contract or internal (in-house) research. Funds are available for experimentation, demonstration, and evaluation and may be used for such services as research design, consultation by outstanding research authorities, data gathering, and other services necessary to document studies and projects.

Certain priorities will be given to programs for disadvantaged youth and curriculum development in new and unique occupational areas. Other areas considered are as follows:

1. Computer instruction and development
2. Increased utilization of equipment
3. High school curriculums and teacher education
4. Joint ventures between education and department of defense to improve vocational education
5. Ways of projecting for training in occupations and educational manpower needs
6. Teacher accreditation for newer occupations
7. Desegregation plans in occupational fields
8. Spin-off benefits to vocational education courses
9. Visual aids
10. Bibliographies
11. Career choices
12. Cost analysis studies in vocational education
13. Summer institutes for teachers
14. Evaluation and/or demonstration projects
15. Adult education research

Research studies require well-developed proposals dealing with significant education problems. Proposals must have statewide and general application.

The following format should be followed in submitting proposals to the Bureau of Occupational Education Research:

## PROPOSAL DOCUMENT

### I. THE COVER PAGE

Nothing precedes this page. It contains the following information:

PROPOSALS FOR RESEARCH AND/OR RELATED ACTIVITIES

SUBMITTED TO THE BUREAU OF OCCUPATIONAL EDUCATION RESEARCH

UNDER THE FEDERAL VOCATIONAL EDUCATION ACT OF 1963

Title: (Be concise; avoid obscure jargon)

Sponsor: (Legal designation of school district, cooperative board, college, university or other educational agency)

Principal Investigator: (Name of person who will conduct the project operations)
(Title and office address)

Approved by: (Superintendent, President, or Chief Officer of institution or department)
(Official title)

Duration of Project:

Funds Requested:

Date of Submission:

## II. BODY OF PROPOSAL

A. Problem: Briefly describe the problem, including the rationale and events leading to the study. Unusual terminology should be defined.

B. Objectives: Include aims and purposes which the study will explore.

C. Related Research: A review of the literature which supports the need for the proposal should be cited, for example, Education Index. Professional opinion supported by published or unpublished documents may be included.

D. Hypotheses: State the hypotheses which are general propositions drawn from existing knowledge of the problem and about which conclusions will be drawn.

E. Procedures: This section depicts what is to be done and how it will be accomplished in order to test each hypothesis. This may be done by searching evidence that will confirm whether or not the consequences that follow will actually occur. Sequential steps stated in the research design may include the following:

1. Sample. Describe the entire population or universe affected within the scope of the problem and the manner of selecting a representative sample of the population.
2. Data. List the kinds of data to be gathered and the means by which such data will be noted. It may be through the use of questionnaires, interviews, rating scales, checklists, analysis of existing information or other sources.

3. Treatment of Data. Show step by step how the data are handled to reach logically the conclusions and indicate the statistical techniques and comparisons to be made which will have relationships to the hypotheses.

## III. THE TIME SCHEDULE

A timetable for the duration of the project should be estimated.

## IV. PERSONNEL

List name, title, and a brief statement of the educational background and occupational experience of the principal investigator who will be directly in charge of the project. Include a similar sketch for any other key personnel such as the person who will perform statistical analyses or write the report.

## V. BUDGET

Allocated funds are not considered as outright grants but allowable costs for actual proposal expenses incurred against approved budget estimates. On a separate page estimate the cost of the proposed study. Factors considered in funding proposals are actual needs, amount of funds available, significance of application of the results of the study, and the total number of proposal requests for any one fiscal year.

Allowable costs include the following:

A. Personnel salaries for

1. Consultants and other professionals on full time, part time, per diem or hourly basis.

2. Secretarial assistance

B. Travel

1. On estimated mileage or public conveyance

2. Lodging on a per diem basis

C. Supplies

1. Stationery, postage

2. Secretarial supplies

3. Duplicating and printing

4. Telephone

D. Fringe benefits

1. Retirement

2. Social security

3. Health insurance

4. Workmen's compensation

E. Miscellaneous

1. Includes all other legitimate costs associated with development of the project provided all such costs are itemized.

The attached forms may be used for funds requested under the proposal.

## SUBMISSION OF PROPOSAL

1. Four signed copies of the proposal are to be submitted to the following address:

Project Director
Bureau of Occupational Education Research
The New York State Education Department
Albany, New York 12224

INSTRUCTIONS: The total program area summarized below must be supported by an OCCUPATIONAL EDUCATION PROJECT BUDGET (form FA-210-2B). Transmit THREE completed copies of this SUMMARY directly to the DIVISION OF OCCUPATIONAL EDUCATION SUPERVISION in the State Education Department.

A Study of Agricultural Off-Farm Occupational Opportunities and Training Needs in Todd County, Minnesota.

MF AVAILABLE IN VT-ERIC SET.
Pub Date - Dec67 97p.; Colloquium paper presented for Agriculture Education 232, the University of Minnesota, in partial fulfillment of the requirements for the master of arts degree.

*VOCATIONAL AGRICULTURE; *OFF FARM AGRICULTURAL OCCUPATIONS; *OCCUPATIONAL SURVEYS; *EDUCATIONAL NEEDS; EMPLOYER ATTITUDES; EDUCATIONAL OPPORTUNITIES; JOB SKILLS; OCCUPATIONAL CLUSTERS; INTERVIEWS; EMPLOYMENT QUALIFICATIONS
TODD COUNTY; MINNESOTA

To obtain information for developing training programs in off-farm agricultural occupations, data were gathered by personal interview from managers of the County's 177 agriculturally related businesses employing 571 individuals, Over half of the businesses were under the occupational family of mechanized agriculture, and the next highest grouping was under agriculture service. High school vocational agriculture training was considered desirable for 69 percent of the job titles. It was anticipated that only 41 new employees would be needed in the 5 years following the survey. Sales, skilled, and managerial employees were needed in greatest numbers. Employees in 91 percent of the job titles needed business and distributive competencies. Recommendations were that (1) the agri-business management courses in some area schools be expanded and intensified, (2) a plan be developed to inform students and parents of training and employment opportunities, (3) a placement procedure to assist employers be developed, (4) emphasis on adult management programs be continued, and (5) programs be developed to assist those wishing to enter farming. A bibliography, the survey instrument, and occupational classifications are included. (DM)

ACKNOWLEDGEMENTS

The author wishes to express appreciation for guidance and counsel from Dr. Milo J. Peterson, Head of Agricultural Education Department, Institute of Agriculture, University of Minnesota, St. Paul, Minnesota. Also for the valuable help from Dr. Paul Marvin and Dr. Edgar Persons of Teacher Training Staff and other members.

The valuable assistance of Mr. Ernest Frier of Mankato Area Vocational-Technical School, who coordinated the state-wide survey of non-farm agricultural businesses and his staff for assistance in conducting the survey and to the agricultural instructors in the county who conducted interviews.

The author wishes to acknowledge especially the assistance of his wife, Ilene, for help in conducting the county-wide survey, and assistance in preparation of the paper.

# CHAPTER I

## INTRODUCTION AND STATEMENT OF THE PROBLEM

### I. INTRODUCTION

This study is a survey of the businesses in Todd County that are directly related to agriculture.

The purpose of the study was to determine the number and type of occupations related to agriculture, what per cent of the employees required an agricultural background, the degree and kind of competencies required and what kinds of training might be indicated.

### II. BACKGROUND, IMPORTANCE AND NEED

A. History of Agricultural Education in the Area.

In the high schools in Todd County the vocational-agriculture department has centered primarily on farm oriented instruction at the secondary level. The adult farmer program has often been inadequate and has only recently expanded into intensive farm management education for area farmers.

In the colloquim paper written in 1959 by William E. Guelker, who was at that time teaching vocational agriculture at Staples in Todd County, it is stated, "For years, in many communities, adult farmer programs have been inadequate--frequently little more than a series of 10 or more general meetings on some agricultural subject or subjects." He also commented that it is "virtually

impossible for a man in a single teacher department to carry on a complete adult program in addition to teaching all day students and young farmers."[1] It was his belief that it would require three instructors to offer a complete high school, young farmer and adult farmer program in the Staples community of any community of comparable size.

Since that time such a program has been put into operation at Staples. In addition, three farm management programs under the Manpower Development and Training Act of 1962 have been completed in the Staples Area Vocational-Technical School. A fourth program is now being conducted at Staples. Similar programs are also in operation in Bertha, Clarissa, Browerville and Long Prairie communities under a pilot project, Concerted Services, which is an experiment in cooperation of all state and federal agencies in solving problems in a county. Three counties in the nation are included in the Concerted Services program - - Todd County in Minnesota, one county in New Mexico, and one in Arkansas.

Up to this time, however, most high schools in Todd County have operated under the traditional one man department in vocational agriculture. Many of these programs could be termed vocational farming rather than vocational agriculture because of the limited scope of the topics offered.

The Staples school system offers the following agriculture courses;

1. Four years of vocational agriculture for high school students.

[1] William E. Guelker, A Proposed Adult Farmer Program for the Staples, Minnesota Community, University of Minnesota, Department of Agricultural Education, St. Paul.

2. One year of technical agriculture for seniors (will include a few juniors for 1966-67 school year.

3. Two sections of adult farm management (to be expanded to three sections).

4. A course on welding for adults.

5. Two sections of shop for adult farmers.

6. An agri-business course for post high school students.

Two schools, Eagle Bend and Clarissa, have an agricultural shop course for 7th and 8th graders. These two schools plus Bertha, Browerville and Long Prairie have vocational agriculture for grades 9 through 12. Long Prairie added an adult instructor for farm management in 1964. They also have an enterprise section. Eagle Bend has had a farm management section for adult farmers for several years. Bertha plans to participate in the farm management farm business record analysis program as part of a farm management program beginning this year. Clarissa has a section of adult farm management.

B. Need for the Study

Description of the Area.

The study covers Todd County located in central Minnesota. The county which includes 28 townships is located in the transitional area where forests and prairies meet. There is wide variation in soil type and topography with much rocky terrain. The farms averaged 169.3 acres in 1959.[1] The farms include a good deal of woodland which leaves less tillable land. There are also numerous lakes, rivers and streams.

1 U.S. Bureau of the Census, United States Census of Agriculture, Minnesota, 1959, United States Department of Commerce, Washington, D. C.

1. Human Resources

The population of Todd County according to the 1959 census was 23,119. The rural population was 88.4 per cent of the total, and urban was 11.6 per cent. The total population of the county decreased from 1950-60 by 2,300 or 9.9 per cent compared to an increase of 13.7 per cent for the state and 18.5 per cent increase for the nation.[1]

2. Agricultural Resources

Farms in the county have increased in size while decreasing in number in response to technological developments. In 1954, there were 3,293 farms; in 1959, there were 3,013, of which 2,395 farms were listed as commercial farms. Increase in farm size was from 158 acres in 1954 to 169.3 acres in 1959. These changes have continued since 1959 at an accelerated rate. In 1959, most of the farms, 88 per cent, had less than $10,000 annual gross income. Fifty per cent had less than $5,000 and only 12 per cent had more than $10,000 annual gross income. This was closely correlated to size of farm.[2]

The major portion of the farm income is from dairy. Feeder pigs are also an important source of income. Corn is raised for grain and silage with most of it used as feed for the dairy herd. Hay is also an important crop.

There are some signs of an increase in the now minor beef industry. Dairy trends are toward larger herds and more mechanization. Few hogs are fed out, but the raising of feeder pigs is an important second enterprise for many farmers.

1 Ibid

2 Overall Economic and Social Development Plan for Todd County, Minnesota, Agricultural Extension Service, Long Prairie, 1964, p.4,32

The largest portion of the farm income is derived from the sale of dairy products, $6,934,015 in 1959. Other estimated sales in 1959 in order of importance were: hogs and pigs - $2,500,000; chickens and eggs - $1,000,000; sheep and lambs - $250,000. Corn, hay and oats are leading crops, used mostly for livestock feed.

3. Business and Industrial Resources.

Todd County industries include dairy products processing plants, a printing firm, a clothing factory, a box factory and a meat packing plant.

There is no one central trading center in Todd County. Sauk Centre, in Stearns County and Alexandria in Douglas County draw trade from the south end of the county and Staples located in the extreme northeast corner of Todd County and Wadena in Wadena County draw trade from the north end of the county. Long Prairie serves the central part of Todd County. There are numerous towns and hamlets scattered throughout the county.

4. Importance of Farming and Non-Farm Agricultural Business in Minnesota

As technology replaced the need for manual labor the output per farm worker has steadily increased so that today one farmer can provide food and fiber for twenty-eight people compared to four people in 1820.[1] In addition to this increased proficiency, many of the service and processing jobs originally performed on the farm have left the farm and now form the basis for agricultural off-farm occupations referred to as "Agri-Business."

1
Ernest E. Freier, Preliminary of the Minnesota Agricultural Off-Farm Occupational Opportunities and Training Needs, Mankato: Mankato Area Vocational Technical School, 1965, p.3

Off-farm agricultural occupations now comprise a large segement of our economy. Farm employment decreased twenty-eight per cent in the last twenty years, while the off-farm agricultural group has increased fifty-two per cent, according to Employment Security figures. There has been a corresponding decline in entrance into farming. Since vocational agriculture has traditionally been viewed as preparation for farming there has been decline of support for this type of training. Counselors may have a confused concept of the term agriculture and parents may lack enthusiasm and confidence in their farming enterprise, as well as accurate and adequate information concerning agriculture.

What has been generally overlooked is the need for more comprehensive and intensive training for those who will farm and also the number and kinds of occupations closely related to farming where a farm background and agricultural training is helpful. Vocational schools can and should adjust curriculum to focus more emphasis on ag-related occupation opportunities and the training needs of those entering these occupations.

Improved curriculums would enable area vocational schools to more closely meet the needs of post high-school students wishing to enter ag-related occupations and also provide increased in service training and retraining of persons now employed in such occupations.

A major block toward progress along these lines is the mistaken idea by many rural youth, their parents and counselors that agriculture means farming. The broader definition of agriculture to include the servicing and processing related to farming and the occupations and professions requiring a knowledge of agriculture would do much to guide interested and competent youth into those

ag-related occupations where their farm background would be an asset. More accurate and complete information regarding these occupations and agriculture in total would enable parents and counselors to give more confident guidance to youth and help to reverse the often negative attitudes toward agriculture in general.

Although the number of farms and farmers in the county continues to decline, the total farm production has increased. The area is still based primarily on agriculture and ag-related business enterprises. In 1959 in Todd County, the highest number of people were employed as farmers and farm managers, farm laborers and unpaid family workers for a total of 4,238 people or 48 per cent of the total labor force.

D. Diminished Demand for Unskilled Labor.

Trends in agriculture have resulted in diminished demand for unskilled labor. Greater mechanization on farms and the substitution of capital for labor has released farm workers for off-farm employment. In place of the unskilled farm laborer, the farmer now relies on specialized services to be provided by well trained technicians as need arises.

A review of figures available from the Employment Security Service[1] reveals a similar trend in all parts of the economy. Most new jobs in the past ten years have been those requiring specialized training with a steady decline in unskilled occupations. For unskilled workers to make the transition into a changing economy they must acquire the necessary skills through training or retraining.

[1] Minnesota Department of Employment Security, Economic Guidelines for Unemployment Insurance

New educational programs need to be developed to meet these training requirements.

1. Emerging Changes in the Programs of Education in Agriculture

Much effort has been made to determine what changes need to be made to meet the educational needs in agriculture that have resulted from the technological developments in farming.

At the present time, the following forms are being considered as part of agricultural education, some of which have been overlooked in the past: [1]

1. Vocational Education in Farming.
2. Vocational Education in off-farm agricultural occupations.
3. Non-vocational education in agriculture.
4. General agriculture.
5. Agricultural education throughout a school system by teachers other than teachers of agriculture.

Pilot programs in high schools in some states have attempted to develop these forms. Other efforts have included farm management programs for beginning and adult farmers and training for off-farm agricultural occupations in area vocational schools, community colleges, and junior colleges.

An example of a training program for off-farm agricultural occupations is the agricultural technician training now offered in junior colleges in California as well as some other states. The California program developed from a survey which indicated a need for a course in applied agriculture science. The curriculum which resulted is broad, including enough background for plant, animal

1 J. R. Warmbrod, New Dimensions in Public School Education in Agriculture. Danville, Illinois: Interstate Printers and Publishers, Inc., 1962, page 68

and engineering technicians to enter and advance in off-farm agricultural occupations.

Technical training at the junior college and area vocational school level provides agricultural industry with a source of technicians who can work under the supervision of professionals. It is necessary to inform businessmen of this source and help them to recognize the value of such agriculturally trained personnel on the technical level.[1]

2. New Legislation and New Dimensions of Vocational Education in Agriculture

To successfully counsel with his students, a teacher of vocational agriculture must be informed of the changes taking place in farm and off-farm agricultural occupations and the opportunities for entry into them. These changes produce new areas of concern because they bring about new needs in the vocational-agriculture program itself. The Vo-Ag programs often have not kept pace with the changes and needs as they have developed.

That agriculture is much more than farming is pointed up by the statistics showing that of a total labor force of 66.7 million, 21.7 million are employed in agriculture. Of those in agriculture, 10 million are employed in distribution, 6 million in service or producing for farmers, and only 5.7 million are farming.[2]

It is a responsibility of the vocational agriculture teacher to help students to see that their choice is not only between

[1] Freier, op. cit., p. 7

[2] Ibid., p. 8

farming and a city job but that there may be many opportunities where his liking for agriculture and his background in agriculture may be helpful. Potential job opportunities for farm youth, who often find no future on the farm, exist in the agriculture business or industry which serves the farmer.

An increasing number of technical supplies and services, more complicated machinery and better training are needed by the decreasing number of farmers who continue to supply food and fiber for more people.

Predictions are that for every man engaged in farming there will be from four to six people in the agricultural business or industry to provide the farmer with technical services and to process and market the farm products.[1] In many areas new programs have been developed to adapt the vocational agriculture program to these changing needs. As mentioned previously agriculturally related curriculums have been developed in the junior college system of California and other states.

In Minnesota several programs have been developed such as the agri-business management course at the Staples area vocational school which trains students for jobs in ag-related industry and for farm operation. Opportunity is provided for cooperative management training for those who are able to pass the management tests. Also offered at Staples and at the area vocational school at Alexandria is a two year course in farm equipment-mechanics.

The Willmar community college initiated agriculture training programs in 1963 including work in soils, agronomy, dairy husbandry

[1] Ibid.

and agriculture science to prepare youths for jobs in agri-business.[1]

Todd County community leaders have expressed concern over the continual movement of youth from the county to urban areas. This concern has been stressed by study groups which have prepared an Overall Economic and Social Development Study made in the interest of the people of Todd County. The Concerted Services pilot project in focusing attention of all agencies solving the human and economic problems of the area, has also noted the movement of youth as well as other age groups from the county.

Proposals from the various discussion groups have centered around attraction of industry to the county, better use of native raw materials and improvement of agriculture in the county. As such proposals are developed they should tend to counter-act the out-migration of youth by providing more and better opportunities for each year's high school graduating class.

As a result of the 1960 census which indicated the relative importance of farming, George-Barden funds were increased by three-quarter million dollars in the central region. The education and training acts of 1962 and 1963 also provide new opportunities.

New dimensions for education in agriculture were outlined by Harold F. Duis, Program Specialist in Agricultural Education, U.S. Office of Education, as follows:[2]

1
Edward C. Hartog, Survey of Agricultural Occupations Other Than Farming in Kandiyohi County, University of Minnesota, Department of Agricultural Education, St. Paul, 1965.

2
Freier, op. cit., p. 9

A. Expansion of Program.

1. Young Farmer needs to be greatly expanded - year round programs, young farmer associations.

2. Adult farmer training more important today then ever before.

3. Larger schools provide more opportunity for agriculture training, multiple teacher departments, special adult teachers with specialties.

4. New Areas - - ARA, Manpower Training Act. New titles may be needed for special training for off-farm agriculture occupations and farm specialties.

5. Area schools supplement high school education -- 13th and 14th years -- agriculture technology.

B. Public Relations -- Promotions by all in Agriculture.

1. Agricultural Development Committee -- opportunities, placement, finance.

2. Counseling -- Agricultural opportunities and follow-up, leadership with facts.

C. Improving Instruction

1. Farm management approach in teaching -- changing role of vocational agriculture teacher.

2. More science of agriculture included in vocational agriculture -- depth, more rigorous.

3. Upgrading teachers. Recruiting more and better candidates for teaching. Pre-service and in-service training emphasis: farm management, philosophy, technical agriculture.

3. Role of Vocational Education in Preparing Workers to Meet Entry Requirements into Skilled Occupations.

As a result of rapid technological change there is an increasing necessity to provide pre-employment training for high school and post-high youth, retraining programs for unemployed adults and instructional programs for employed workers. Programs for employed workers should be expanded to enable workers to keep pace with the technological changes affecting their jobs.

Vocational-Technical education is more than training in a specific subject or manual dexterity. It also includes training in the social skills, knowledges, and attitudes that will enable an individual to enter and progress in a socially useful vocation. Such education should help make youth and others aware of the many skills needed in a complex society for successful employment.

The Staples program through constant evaluation and research is attempting to provide technical training for youth and adults which includes the latest knowledge and information available.

4. Responsibility of the Staples Area Vocational-Technical School.

The Staples Area Vocational-Technical School as well as other area vocational schools has a responsibility to furnish leadership in establishing programs for training of farm youth to provide them with the skills required for jobs in larger communities. These schools also have responsibility for retraining and up-grading the skills of older workers for employment in trade, industrial, technical, business, distributive and agricultural occupations.

To meet the responsibility for training, it is necessary to determine what the employment opportunities are, what competencies are

required, how many trainees are available and then to develop training programs in the school to meet the needs.

III. Purpose of the Study

The general purpose of this study was to obtain information regarding off-farm agricultural occupations in Todd County, Minnesota. The information is to be used to develop training programs for occupations related to production agriculture such as processing and distribution where agricultural knowledge and skills are either highly desirable or essential for successful job entry and advancement.

Similar information has been compiled in nine other counties for an over-all study including 10 counties under the direction of Ernest E. Freier, of the Mankato Area Vocational-Technical School, Mankato, Minnesota. While the information for Todd County has been included in the 10 county study, this paper will deal only with the data for Todd County.

The specific purposes for the Todd County study as well as for the larger study were as follows:

1. To identify present and emerging off-farm agricultural occupations.
2. To determine opportunities for employment in off-farm agricultural occupations.
3. To determine the competencies required for entrance into these occupations.
4. To determine the need for occupational training and/or retraining to increase the vocational competence of present and potential employees.

5. To determine the need for pre-employment vocational education in off-farm agricultural occupations.
6. To list competencies needed to enter and job title characteristics.
7. To group job titles into occupational groups for which there are common technical educational needs.

The specific questions to be answered included the major function of the business or firm, the percentage of gross income agriculturally oriented, total number of employees, the number of employees needing agricultural competencies, the nature of the competencies required and the new job titles foreseen in the next five years.

## CHAPTER II

## REVIEW OF LITERATURE

There have been a number of related studies including the ten county study, which included Todd, Anoka, Fillmore, Kandiyohi, Yellow Medicine and five other counties.

In the preliminary summary of Anoka, Fillmore, Kandiyohi and Yellow Medicine counties, Ernest E. Freier estimates that for the thirteen Vo-Ag departments in the four counties sixteen persons could find employment, if qualified, per department. About ten more per department would be needed for replacement for a total of twenty-six for each department each year.[1]

In the survey in Kandiyohi County, Hartog[2] found that agricultural competencies were needed in almost every field of business in the county for a total of twenty-three different types of businesses. Seventy six per cent of the male employees for the businesses interviewed needed competencies in agriculture.

The Missouri study by Griffin[3] included 112 different firms with 615 employees needing agricultural competencies in 80 different occupations. Most of the firms were small with fewer than 20 employees and almost one-half of the agricultural jobs were at the

[1] Ibid, p. 14

[2] Hartog, op. cit.,

[3] Warren L. Griffin, "Agricultural Workers Needed in Missouri," The Agricultural Education Magazine, August, 1964.

semi-skilled level with skilled workers making up the next largest group. Workers needing agricultural backgrounds were found mainly in farm machinery businesses, feed, seed, and fertilizer, plant products and services and lumber companies.

In the paper "A Proposed Adult Farmer Program for the Staples community," Guelker[1] showed the need for expanding the kinds of agriculture education being offered to include adult farm management and an agri-business course for post high school students.

The California studies[2] have shown the development of agricultural related curriculums in the junior college system. Sutherland and Thompson[3] reported that of 24,305 employees in 327 businesses in 14 California centers, one-fifth needed training in agriculture. Over 1400 new agriculturally trained persons were needed in these companies to fill positions existing and anticipated. High school training in agriculture was sufficient for a large proportion of the semi-skilled jobs but more advanced junior college and college training was needed for sales personnel, consultants, supervisors, and managers. Halterman[4] showed evidence that training programs for occupations related to agriculture should be at area vocational

4
Jerry J. Halterman, "Technicians in Agriculture," Research Project, Modesto Junior College, Modesto, California, 1962.

schools. These programs should be designed for specific occupations and supply employees for that occupation throughout a state wide area.

In a 14 county study by Warmbrod[5] in Illinois it was found that for each 100 workers requiring agricultural competencies in population centers of less than 25,000 there would be 10 technicians, 50 requiring some post high-school technical education, 21 requiring post high school non-technical education and 19 requiring only high school graduation. For population centers over 25,000 there were 28 technicians, 39 requiring some post high school technical education, 7 needing post high school non-technical education, and 26 needing only high school graduation.

A review of the literature indicates a demand for a large number of employees trained in agriculture. Programs to fill this demand need to be developed by the public educational institutions of Minnesota as well as in other states.

## CHAPTER III

## PRESENTATION OF DATA

A. Population Studied, Sample Source of Data.

The population studied included all of the agriculturally related business in Todd County. The sample included all of these businesses that were listed in telephone directories and some that were not. If any were ommitted it was unintentional. The method of determining whether the business was one needing agriculture training is discussed under the section on method and procedure.

Data was gathered by personal interview with the manager of each business.

B. Method and Procedure, Treatment of Data.

For this study an off-farm agricultural occupation was considered as one in which the worker does not work on a farm or ranch but needs competencies in one or more of the primary areas of animal science, plant and soil science, farm management and agricultural mechanization.

An off-farm agricultural business was considered any business providing marketing, processing, distribution, or services to production agriculture.

On the basis of these definitions all of the businesses in the county meeting these requirements were listed by Robert Johnson, Vocational Agriculture instructor at Long Prairie, Norbert Phillips,

Vocational Agriculture instructor at Bertha and the author. Donald Barstad, former Vocational Agriculture instructor at Clarissa and Noel Hatle, Vocational Agriculture at Long Prairie also assisted in collection of data. If there was any question as to whether the firm should be included, the employer was contacted. If any of his employees required agriculture competencies, the interview was completed.

C. Information Concerning Firms

1. Type and Function of Firms.

The data that follows has been included in the ten county survey data assembled and analyzed by Ernest E. Freier of the Mankato Area Vocational-Technical School at Mankato, Minnesota. Only data from Todd County is included in this paper.

Table I, is a distribution of 177 firms according to the major function of the firm. The largest number was retailing, 103, and the next highest category was service with 51. There were 11 firms whose major function was processing, 5 purchasing, 4 transportation and 1 each for wholesaling and warehouse. No firms had a major function of manufacturing, construction, contracting, financing or governmental regulating. Table I is found on the following page.

2. Levels of Gross Income.

Table II is a grouping of the firms by the percentage of gross income that is agriculturally oriented. One hundred and fifty-seven firms had more than 50 per cent of their gross income agriculturally oriented. Twenty firms had less than 50 per cent of their gross income agriculturally oriented.

TABLE I

CLASSIFICATION OF BUSINESSES OR FIRMS
ACCORDING TO MAJOR FUNCTION

| Function | Number | Function | Number |
|---|---|---|---|
| Retailing | 103 | Contracting | - |
| Wholesaling | 1 | Servicing | 51 |
| Manufacturing | - | Transporting | 4 |
| Processing | 11 | Warehousing | 1 |
| Purchasing | 5 | Financing | - |
| Constructing | - | Governmental regulating | - |
| | | Total | 177 |

TABLE II

NUMBER OF BUSINESSES OR FIRMS REPORTING
VARIOUS LEVELS OF GROSS INCOME
FROM AGRICULTURE

| Per Cent Gross Income | Number of Businesses |
|---|---|
| 90 - 100 | 79 |
| 80 - 89 | 9 |
| 70 - 79 | 23 |
| 60 - 69 | 21 |
| 50 - 59 | 25 |
| 40 - 49 | 6 |
| 30 - 39 | 5 |
| 20 - 29 | 4 |
| 10 - 19 | 2 |
| 0 - 9 | 3 |
| Total | 177 |

3. Number of Employees.

In Table III which shows the number of people employed at different skill levels, men exceeded the number of women needing ag competency at all levels except clerical where there were 27 women compared to 12 men.

TABLE III

NUMBER OF PEOPLE EMPLOYED AT DIFFERENT LEVELS NEEDING AG COMPETENCY

| Level | Male | Female | Level | Male | Female |
|---|---|---|---|---|---|
| Professional | 21 | 2 | Clerical | 12 | 27 |
| Technical | 6 | 1 | Skilled | 98 | 6 |
| Managerial | 167 | 21 | Semi-skilled | 75 | 5 |
| Supervisory | 8 | - | Unskilled | 36 | 1 |
| Sales | 39 | 14 | | | |

The total number of employees, including those needing ag competency employed by the firms interviewed are shown in Table IV.

TABLE IV

TOTAL NUMBER OF EMPLOYEES WORKING IN BUSINESSES OR FIRMS

| | Male | Female |
|---|---|---|
| Full Time | 1,342 | 558 |
| Half to Full Time | 27 | 9 |
| Less than Half Time | 231 | 18 |
| Total | 1,600 | 585 |

4. Major Product or Service

In Table V, which describes major products or services, the largest groupings are gasoline service stations and bulk delivery-18,

TABLE V

MAJOR PRODUCTS OR SERVICES OF BUSINESS OR FIRM

| | | | |
|---|---|---|---|
| Artificial Insemination | 4 | Hatchery | 2 |
| A.S.C. Service | 1 | Hardware Store | 15 |
| Auto & Farm Machinery Sales | 8 | Heating & Plumbing | 1 |
| Auto and Truck Sales & Service | 3 | Insurance | 6 |
| Banking Service | 6 | Livestock | 1 |
| Communications | 3 | Loan Agency | 3 |
| Dairy Products | 12 | Lumber and Building Supplies | 6 |
| Education Service | 5 | Meat Products | 3 |
| Farm Machinery and/or Equipment | 17 | Nursery Service | 1 |
| Farm Service | 1 | Petroleum & Farm Supplies (Co-op) | 8 |
| Farm Supplies | 5 | Real Estate | 4 |
| Feed (Sales, Grinding, Manufacture) | 6 | Utilities | 1 |
| Feed, Seed & Fertilizer | 4 | Veterinarian Service & Supply | 6 |
| Food Products | 6 | Accounting Services | 6 |
| Gasoline Service Stations & Bulk Delivery | 18 | Research | 1 |
| General Store | 5 | Metal Work | 5 |
| Grain, Feed & Seed (Elevators) | 1 | Transportation | 3 |
| | | Total | 177 |

farm machinery and/or equipment - 17, hardware store - 15, and dairy products - 12. The next highest grouping is petroleum and farm supplies (co-op) with 8 firms stating this as their major product or service. All other categories have 6 or less firms offering the same major product or service.

Although many different kinds of products and services are represented, it is apparent that most of the businesses and firms provide farm input items such as feed, seed, fertilizer and farm machinery.

5. Occupational Families

Over half of the businesses can be grouped under the occupational family of mechanized agriculture, the next largest group is agriculture service with 26.5 per cent of the total, and 19.3 per cent in animal and poultry science. A small per cent, 2.8, were in the occupational family of plant and soil science and only 1 business in horticulture. This information is found in Table VI.

(See Appendix I for grouping of job titles)

TABLE VI

NUMBER AND PER CENT OF AGRICULTURAL BUSINNESSES BY OCCUPATIONAL FAMILY

| Occupational Family | Number of Businesses | Per Cent of Total |
|---|---|---|
| 1. Animal and Poultry Science | 34 | 19.3 |
| 2. Plant and Soil Science | 5 | 2.8 |
| 3. Mechanized Agriculture | 90 | 50.8 |
| 4. Agriculture Service | 47 | 26.5 |
| 5. Horticulture | 1 | .6 |
| Total | 177 | 100.0 |

Of the 571 employees, 50 were part-time - 43 men and 7 women. The largest number of workers were found in the managerial level, 192 or 34 per cent. The next highest level was unskilled with only half as many workers, 97 or 17 per cent. Each of the levels of sales, skilled and semi-skilled had approximately 11 per cent of the workers or 61, 62, and 64 workers respectively.

(See Appendix II for classification of job titles)

TABLE VII

NUMBER OF WORKERS, MALE AND FEMALE, BY OCCUPATIONAL LEVEL

| | Full Time | | Part Time | | | |
|---|---|---|---|---|---|---|
| | Male | Female | Male | Female | Total | Per Cent |
| Professional | 23 | 1 | 1 | 0 | 25 | 4.0 |
| Technical | 25 | 6 | 1 | 1 | 33 | 6.0 |
| Managerial | 166 | 24 | 2 | 0 | 192 | 34.0 |
| Supervisory | 6 | 0 | 1 | 0 | 7 | 1.0 |
| Sales | 39 | 13 | 7 | 2 | 61 | 11.0 |
| Clerical | 5 | 19 | 2 | 4 | 30 | 5.0 |
| Skilled | 53 | 1 | 8 | 0 | 62 | 11.0 |
| Semi-skilled | 56 | 1 | 7 | 0 | 64 | 11.0 |
| Unskilled | 81 | 2 | 14 | 0 | 97 | 17.0 |
| Total | 454 | 67 | 43 | 7 | 571 | 100.0 |

D. Information Concerning Employees Needing Ag Competency

1. Methods of seeking employment.

Personal interviews and written applications were used to place

workers by all occupational levels; The State Employment Service and College Placement bureaus by only three levels. Advertisements were used more frequently by the managerial and sales levels than by other occupational levels. Written applications were used most frequently to fill positions at the clerical levels.

A summary of means of seeking employees, (Table IX), including all occupational levels shows the personal interview the most frequently used source - 200 cases, and the State Employment Service used least frequently, with only 5 cases reported. The next most frequently used source, 71, was "other" which was explained as the purchase or establishment of own business or through associations such as the Creamery Association. Written applications were used by 52 job titles, advertisements by 40, friend's recommendation by 28 and Public High Schools by 23. Little use was made of other sources of employment with only 14 cases for persons dropping in to seek employment, 10 cases using College Placement Bureaus and only 16 using Area Vocational-Technical Schools.

Employers apparently consider the public schools, colleges or the Employment Service only infrequently as possible sources for employees. Area vocational schools and high school vo-ag departments could perhaps do a better job of informing local employers of the kinds of skill and knowledge students are acquiring which would qualify them for certain kinds of jobs. Some means of making parents, students, and counselors more aware of possibilities for employment should be developed. Information concerning source of employment by occupational level as indicated by the managers of businesses in Todd County employing workers needing ag competency is found in Tables VIII and IX.

TABLE VIII

OCCUPATIONAL LEVEL

2. Educational Requirement for Entrance Into Job Titles

The most frequent educational level for entrance into job titles was high school completion. Completion of grade twelve was cited as a requirement for 60 per cent of the job titles. The next highest category was technical training required for 13 per cent of the job titles. Less than high school was required for 9 per cent of the job titles, a college degree for 7 per cent, and 8th grade for 3 per cent. No preference or no response was reported for 2

per cent of the titles listed. No job title required either a masters' or a doctors' degree.

Less than 8th grade as an entrance requirement was reported for some job titles on the managerial, skilled, semi-skilled and unskilled levels. Less than 12th grade was required by some job titles on these levels and also on the sales and clerical level. However, managers frequently stated that although some of their employees have less than the amount of education checked, they felt that for current day conditions more education is essential. There may have been some confusion on this question as to present employment levels rather than the educational level desired for new employees.

Sixty-five per cent of the job titles requiring a college degree were on the professional level and 31 per cent on the managerial level.

Eighty-five per cent of all job titles required high school completion and 25 per cent required training beyond high school. Only 15 per cent of the job titles had less than 12 years of education as an entrance requirement.

The educational level required by the majority of job titles indicates little opportunity for anyone with less than high school training. Occupational levels requiring post high school training offered the most opportunities for employees with technical training.

Information concerning educational requirements for entrance into job titles according to occupational level is found in Table X.

TABLE X

NUMBER AND PER CENT OF JOB TITLES REQUIRING VARIOUS EDUCATIONAL LEVELS FOR ENTRANCE INTO JOB TITLES BY OCCUPATIONAL LEVEL OF JOB TITLE

| Educational Level | Professional No. % | Technical No. % | Managerial No. % | Supervisory No. % | Sales No.% | Clerical No. % | Skilled No. % | Semi-skilled No. % | Unskilled No.% | TOTAL No.% |
|---|---|---|---|---|---|---|---|---|---|---|

| Total | 23 | 3 | 148 | 5 | 33 | 40 | 47 | 31 | 11 | 341-100 |

3. Salary Range

The highest average starting salary per month, $540, and highest average maximum salary, $667, was found on the professional level. Supervisory and managerial levels ranked second and third in both respects. Lowest average starting salaries were found on the unskilled, clerical and

semi-skilled levels, $290, $289, and $286, respectively. The lowest average maximum salaries were found on the skilled, clerical and semi-skilled levels, $342, $341, and $340, respectively. The average starting salary for all full-time workers was $338, and for all part-time workers the average starting salary was at the rate of $212 per month had they worked full-time. Full-time average maximum salary was $413 per month and for part-time workers it was $238.

Only 34 job titles indicated a maximum salary over $700 per month; 14 on the professional level, 18 on the managerial level, 2 on the sales level and 1 on the clerical level.

The greatest difference between starting and maximum salaries within a job skill level was on the professional level and the least difference on the skilled level. No difference was reported for the technical level and $60 for the unskilled level. These figures may not be significant since only a few job titles were included.

With the exception of the technical and unskilled levels, salaries corresponded closely with occupational level, and decreased with each descending level, although clerical and skilled levels were approximately even. In general it was shown that the more training required for the occupational level, the higher the salary potential would be.

The average starting and maximum salaries for each occupational level are found in Table XI.

4. Importance of Farm Background, Previous Work Experience, High School Vo-Ag Training and College Degree in Agriculture

a. Farm background

The business managers interviewed considered a farm background as unimportant for only 14 or 4.1 per cent of all job titles

TABLE XI

| over 700 | 2 | 14 | | | 1 | 18 | | | | 2 | | 1 | | | | | | | 4 | 34 | | |
| AVG. | $540-667 | | $350-350 | | $387-455 | | $416-516 | | $315-365 | | $289-341 | | $326-342 | | $286-320 | | $290-350 | | $338-413 | | $212-238 | |

requiring agricultural competencies. A farm background was considered essential for 22.8 per cent of the job titles and desirable for 73.1 per cent of the job titles.

For the three job titles on the technical level, managers considered a farm background essential for 2 of the job titles and desirable for 1 job title. The professional and supervisory levels had the next highest per cent of job titles for which managers considered a farm background essential, 52 and 33.3 per cent, respectively.

It is apparent from this information that farm youth possess a natural advantage in preparation for most jobs requiring agricultural competencies. Information concerning the importance of a farm background is found in Table XII.

b. Previous work experience

Previous work experience of employees, in the opinion of the managers interviewed, was desirable for 8 or 88.8 per cent of all part-time job titles and essential for 1 or 11.2 per cent of the job titles. For all full-time job titles, managers considered previous work experience essential for 80, or 24.8 per cent, of the job titles; desirable for 230, or 71.2 per cent, of the job titles; and unimportant for only 13, or 4.0 per cent of the job titles.

Previous work experience was found to be most important on the managerial level with managers stating that it was essential for 37.7 per cent of the job titles. On the clerical and professional levels managers considered previous work experience of employees essential for only 3.2 per cent and 10.0 per cent, respectively.

This information, summarized in Table XIII, indicated that employment opportunities will be greatest for persons with previous work experience.

TABLE XII

NUMBER AND PER CENT OF JOB TITLES ON EACH OCCUPATIONAL LEVEL FOR WHICH BUSINESS MANAGERS CONSIDER A FARM BACKGROUND ESSENTIAL, DESIRABLE OR NOT IMPORTANT

| LEVEL | Essential | | Desirable | | Not Important | |
|---|---|---|---|---|---|---|
| | No. | Per Cent | No. | Per Cent | No. | Per Cent |
| Professional | 13 | 52 | 10 | 42 | 1 | 5 |
| Technical | 2 | 66.6 | 1 | 33.3 | | |
| Managerial | 38 | 25.5 | 108 | 72.5 | 3 | 2 |
| Supervisory | 1 | 33.3 | 2 | 66.6 | | |
| Sales | 7 | 21 | 27 | 79 | | |
| Clerical | 1 | 3.7 | 23 | 85.2 | 3 | 11.1 |
| Skilled | 8 | 15.4 | 41 | 78.9 | 3 | 5.7 |
| Semi-skilled | 4 | 13 | 25 | 80.6 | 2 | 6.4 |
| Unskilled | 1 | 12.5 | 7 | 87.5 | | |
| All Full Time | 77 | 22.8 | 246 | 73.1 | 14 | 4.1 |
| All Part Time | 2 | 28.6 | 3 | 42.8 | 2 | 28.6 |

c. Vo-ag training

For all full-time job titles, manager's responses indicated high school Vo-ag training for employees as desirable for 69 per cent of the job titles, unimportant for 30 per cent, and essential for only 1 per cent of the job titles. For 7 part-time job titles, managers felt Vo-ag training was desirable for 3 job titles and unimportant for 4 job titles. The 3 full-time job titles for which Vo-ag training was considered essential were on the managerial level.

TABLE XIII

NUMBER AND PER CENT OF JOB TITLES ON EACH OCCUPATIONAL LEVEL FOR WHICH MANAGERS CONSIDER PREVIOUS WORK EXPERIENCE ESSENTIAL, DESIRABLE OR NOT IMPORTANT

| LEVEL | Essential | | Desirable | | Not Important | |
|---|---|---|---|---|---|---|
| | No. | Per Cent | No. | Per Cent | No. | Per Cent |
| Professional | 2 | 10.0 | 15 | 75.0 | 3 | 15.0 |
| Technical | 1 | 33.3 | 2 | 66.6 | | |
| Managerial | 55 | 37.7 | 89 | 60.9 | 2 | 1.4 |
| Supervisory | | | 3 | 100.0 | | |
| Sales | 5 | 15.1 | 26 | 78.8 | 2 | 6.1 |
| Clerical | 1 | 3.2 | 28 | 90.4 | 2 | 6.4 |
| Skilled | 12 | 24.0 | 36 | 72.0 | 2 | 4.0 |
| Semi-skilled | 4 | 13.3 | 24 | 80.0 | 2 | 6.7 |
| Unskilled | | | 7 | 100.0 | | |
| All Full Time | 80 | 24.8 | 230 | 71.2 | 13 | 4.0 |
| All Part Time | 1 | 11.2 | 8 | 88.8 | | |

While managers did not consider vo-ag training as essential for many of the jobs, they rated it as highly desirable for 69 per cent of the job titles, indicating a high interest in workers with this type of training.

This information is found in Table XIV.

d. College degree

For only 5 per cent of the job titles was a college degree in agriculture considered essential by the persons interviewed. All of

TABLE XIV

NUMBER AND PER CENT OF JOB TITLES ON EACH OCCUPATIONAL LEVEL FOR WHICH MANAGERS CONSIDER HIGH SCHOOL VO-AG TRAINING ESSENTIAL, DESIRABLE, OR NOT IMPORTANT

| LEVEL | Essential | | Desirable | | Not Important | |
|---|---|---|---|---|---|---|
| | No. | Per Cent | No. | Per Cent | No. | Per Cent |

| All Part Time | | | 3 | 43.0 | 4 | 57.0 |

those job titles were on the professional level except 1 which was on the skilled level. For 8.5 per cent of the job titles a college degree was considered desirable but for the great majority, 86.5 per cent, a college degree was considered unimportant.

A college degree was considered unimportant by the managers interviewed for 97.8 per cent of the job titles on the skilled level, 96.6 per cent of the job titles on the semi-skilled level and for all

of the job titles on the unskilled level.

The research indicated that for the majority of job titles requiring ag competencies, high school vo-ag training is desirable but a college degree is not important.

TABLE XV

NUMBER AND PER CENT OF JOB TITLES ON EACH OCCUPATIONAL LEVEL FOR WHICH MANAGERS CONSIDER A COLLEGE DEGREE IN AGRICULTURE ESSENTIAL, DESIRABLE OR NOT IMPORTANT

| LEVEL | Essential | | Desirable | | Not Important | |
|---|---|---|---|---|---|---|
| | No. | Per Cent | No. | Per Cent | No. | Per Cent |

| All Part Time | | | | | 7 | 100.0 |

5. Age Requirements for Entrance Into Job Titles.

Minimum age requirements were related to the type and level of

job. A small proportion of workers 18 and under were accepted in all job titles except those on the professional, technical and supervisory levels. The proportion, however, was very small. For the largest proportion of job titles on the professional levels, 25 - 34 was the minimum age considered for entrance. Levels for which 19 - 24 was indicated as the minimum age were managerial, 56.7 per cent; technical and supervisory, 100 per cent; sales, 59 per cent; clerical, 77.8 per cent; skilled, 82.7 per cent; semi-skilled, 82.6 per cent; and unskilled 87.5 per cent. For none of the job titles was a minimum age over 44 years indicated.

Maximum age showed no definite pattern. However, for all job titles except sales 55 - 64 was the maximum age indicated for the highest proportion of job titles. The largest proportion of job titles for which 65 and over was indicated as the maximum age were found on the sales level.

The most frequently preferred age was 35 - 44 years. Almost half (49 per cent) of the job titles managers preferred this age bracket. Next in order of preference was 25 - 34 years, with 38 per cent. Other preferred ages were: 19 - 24, 5 per cent; 45 - 54, 7.6 per cent; and 55 - 64, 1 job title or 0.4 per cent.

The information given shows that managers have a definite preference for workers between the ages of 25 - 44. There is very little opportunity for older workers or those under age 18 to enter the various job titles.

The need for youth to continue their training rather than seeking employment before the age of 18 is clearly indicated. It would also seem that further research is necessary to determine the reasons for discrimination against hiring older workers and whether these reasons are

justified.

Age requirements for entrance into job titles are shown in Tables XVI - XVIII.

TABLE XVI

NUMBER AND PER CENT OF JOB TITLES FOR WHICH MANAGERS INDICATED VARIOUS MINIMUM AGE REQUIREMENTS FOR ENTRANCE BY OCCUPATIONAL LEVEL

| Age | Professional | | Technical | | Managerial | | Supervisory | | Sales | | Clerical | | Skilled | | Semi-skilled | | Unskilled | | TOTA |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | No. | % | No. | % | No. | % | No. | % | No. | % | No. | % | No. | % | No. | % | No. | % | No. |

| 65 & Over | | | | | | | | | | | | | | | | | | | |

6. Future Anticipated New Employees

There was very little turnover anticipated. Turnover in 22 job titles was predicted at the rate of 1 turnover per job title or 1.1 per cent of the total jobs. Most interviewees were reluctant to predict what new employees they might have next year or in the next 5 years. Several were pessimistic regarding the future but others had definite plans for expansion. There were fifty-four new employees last year with twenty-one anticipated new next year and forty-one anticipated new in the next 5 years.

TABLE XVII

NUMBER AND PER CENT OF JOB TITLES FOR WHICH MANAGERS INDICATED VARIOUS MAXIMUM AGES FOR ENTRANCE BY OCCUPATIONAL LEVEL

The most opportunity for new employees appeared to be in job titles on the skilled, semi-skilled and managerial levels.

This information is found in Table XIX.

7. Training Opportunities.

There are few training opportunities for employees other than those offered by industry; most of which are in the form of on the job informal training. There were 341 job titles for which managers indicated training opportunities were offered by industry, 34 offered by colleges, or public school and college. Of the training offered by industry, 49.3 per cent was informal on the job training, 37.2 per cent was specialized courses away from the firm, 9.3 per cent was informal on the job training and very small percentages in

the form of evening school, part time day classes, correspondence courses and other types of training.

Training opportunities for all job titles are summarized in Table XX.

8. Activity of Persons Needing Competencies in Agriculture

Almost all job titles, 95 per cent, required meeting farm people and a large percentage, 81 per cent, required meeting non-farm people. A high proportion of those meeting farm people are on the managerial level where 99 per cent are expected to have face to face contact with farm clientele. Skilled, sales and technical level personel are all expected to meet farm people in the course of their job.

TABLE XIX

NUMBER OF NEW EMPLOYEES LAST YEAR, NUMBER OF NEW EMPLOYEES ANTICIPATED FOR NEXT YEAR AND FOR THE NEXT FIVE YEARS AND AVERAGE ANNUAL TURNOVER BY OCCUPATIONAL LEVEL

| JOB TITLE LEVEL | Employed new Last Year | Anticipated New Next Year | Anticipated New Next 5 Years | Average Annual Turnover |
|---|---|---|---|---|
| Professional | 3 | 3 | 5 | 1 (2)* |
| Technical | 0 | 0 | 0 | 0 |

| TOTAL | 54 | 21 | 41 | 1.1 (22) |

* Number of job titles for which turnover was indicated.

Selling was required of 70 per cent of all job titles, estimating costs of 61 per cent, and advising, consulting and diagnosing of 60 per cent. All other activities involved less than fifty per cent of the job titles.

Job titles on the professional, managerial, sales, clerical, skilled and semi-skilled levels required all activities. Technical and unskilled levels required the fewest activities.

Buying was mainly a function of the managerial level as was appraising work of others and inducting new personnel.

The managerial level was concerned with all activities and had the highest proportion of all job titles for each activity.

Since meeting farm people and selling are activities required of such a high proportion of persons on all occupational levels, specialized training along these lines should prove beneficial.

The wide range of activities engaged in by managers indicates

TABLE XXI -PART I

NUMBER AND PER CENT OF JOB TITLES FOR WHICH MANAGERS INDICATED EMPLOYEE ACTIVITIES OUTSIDE THE FIRM BY OCCUPATIONAL LEVEL

| Activity | Professional No. % | Technical No. % | Managerial No. % | Supervisory No. % | Sales No. % | Clerical No. % | Skilled No. % | Semi-skilled No. % | Unskilled No. % | TOTA No. |

* The per cent of job titles with personnel participating in each activity is based on the total number of job titles in each occupational level as shown at the bottom of the table.

9. Working With Production, Products, Materials and Services.

There was no definite pattern established for employees with different job titles on working with production, products, materials and services. The activity most common for employees with all job titles was calculating cost, 53.1 per cent, and the next most common activities were the use of technical and service manuals and parts lists, 40.2 per cent, and planning production or service, 35.4 per cent. Employees did testing in

33.1 per cent of all job titles and inspecting in 34.3 per cent. All other activities were indicated for employees in less than 30 per cent of the job titles.

On the professional level the employee activities indicated for most job titles were planning production or service, calculating cost and developing techniques. The managerial level personnel engaged in all activities, with the greatest number calculating cost, planning production or service, using technical and service manuals and parts lists, inspecting, testing, and developing techniques.

Mixing, assembling, making and/or building, and testing were engaged in by the skilled, semi-skilled and unskilled level personnel to a greater degree than by people in other job title levels.

This information is found in Table XXII.

10. Working With Firm's or Customer's Equipment, Tools, Supplies and Instruments.

Very few of the employees in the various job titles were connected with construction or designing. These were found mostly at the skilled, semi-skilled and managerial levels.

Operating, maintaining, and adjusting was most frequently a function for employees in all job titles with 51.3 per cent, 48.9 per cent, and 45.7 per cent, respectively reporting these kinds of activities. Inspecting, testing and trouble shooting was done by employees in 41.9 per cent of all job titles.

Assembling was done mostly by the skilled and semi-skilled level employees but also by those on the managerial level.

Selecting was done by personnel on the professional, managerial, sales, skilled, and semi-skilled levels, with the managerial and technical level employees engaged in this function more frequently than the others.

| TOTAL NUMBER OF JOB TITLES | 23 | 3 | 148 | 5 | 33 | 40 | 47 | 31 | 11 | 341 |

*The per cent of job titles with personnel participating in each activity is based on the total number of job titles in each occupational level as shown at the bottom of the table.

The information regarding work with the firm's or customer's equipment, tools, supplies and instruments is found in Table XXIII.

11. Working with Business Problems by Job Title Levels.

The business problems most common to all job title levels are handling money, keeping records and accounts, inventory and filing.

The managerial level employee is most involved in business problems with professional, sales and clerical level employees also involved to a greater degree than technical, supervisory, skilled, semi-skilled and unskilled personnel.

Professional and technical level personnel were most involved in making technical reports while speech making was primarily a function of the professional level.

This information is found in Table XXIV.

12. Job Titles Associated with Animal Husbandry, Crops and Soils.

A higher percentage of job titles on the professional level required knowledge in animal husbandry, crops and soils than did those on other levels. Managerial and sales level positions also required a wide range of knowledge in all areas for successful job entry and advancement.

The professional level required the highest degree of knowledge in livestock, especially beef, dairy and swine. In crops, professional personnel needed to be most knowledgable about growing of oats, soybeans, and grasses. High skill and knowledge levels were also required for crops such as corn, alfalfa, sweet clover, and clover.

Three job titles on the technical level required knowledge of livestock, one required knowledge of crops and one required knowledge of soils.

The job titles on the managerial level required a high degree of

| Other | 1- 4 | | 5- 3 | | 1- 3 | 1- 3 | | | | 8- 3 |
| TOTAL NUMBER OF JOB TITLES | 23 | 3 | 148 | 5 | 33 | 40 | 47 | 31 | 11 | 341 |

*Based on total number of job titles in each occupational level as shown at bottom of table.

knowledge of animal husbandry, crops and soils, with knowledge of corn ranking highest, 56 per cent, and knowledge of dairy cattle next, 55 per cent.

For all job title levels the interviewees ranked the knowledge of dairy cattle and corn as being most important. In the soils area the highest proportion of jobs required knowledge of fertilizers and chemicals.

Only 5 per cent of all job title levels required knowledge of goats and 9 per cent required a knowledge of horses. Knowledge of sheep, forestry, wheat, barley, rye and flax, soil testing, soil conservation, soil classification, horticulture and food handling was not a high priority prerequisite for job entry and advancement when all job levels were considered.

In general, the kind of knowledge and skill required reflects the type of farming in the county. It also indicates the need for specialized training of personnel in rapidly developing technology in the areas of crops, soils and animal husbandry.

This information is found in Table XXV.

13. Competencies in Major Areas.

It was found that the competencies ranking highest for employees on all occupational levels were those in the supporting business and distributive area including such skills as salesmanship, accounting, buying and customer relations.

The highest proportion of employees needing competencies in agriculture mechanics were found on the skilled, managerial and sales levels, 98, 89, and 88 per cent, respectively. Agriculture business management also ranked very high with these competencies being required by personnel in 89 per cent of the job titles on the sales level and

*Per Cent of all job titles on this occupational level as shown at bottom of table.

**Of all job titles, 7, job titles required knowledge of food handling and processing.

87 per cent on the managerial level.

Supporting trade and industrial competencies were necessary for employees in 72 per cent of all job titles and were of most importance to those on technical, skilled, managerial and semi-skilled levels.

Animal, plant, and soil science competencies were less important for personnel on all levels, except for animal science required by all (3) job titles on the technical level.

The importance of and wide range of agricultural competencies needed by employees in ag-related jobs in a rural area are clearly supported by the responses given by the managers interviewed. The close correlation of supporting business and distributive competencies with agricultural competencies is also apparent. This may imply the need for increased training in these competencies. The wide range of duties performed by a manager in a small business is reflected by the competencies required on the managerial level.

This information is summarized in Table XXVI.

13. Degree of Competencies Needed.

An essential part of establishing training programs is the knowledge of the subject matter considered most important. By assigning a value of 4-3-2-1, for essential, highly desirable, useful and not important, respectively, each response as given by the managers interviewed was given a weighted frequence. The responses were totaled and divided by total interviews for each job title and also for all job titles combined to determine the degree of competency needed.

All competencies were rated comparatively high for the professional level positions reflecting the need for professional personnel to have a high degree of knowledge and skill in all areas.

On the technical level, all competencies were rated useful or above for employees except dairying, salesmanship, bookkeeping and customer relations. The skills required reflects the technical nature of work for employees on this level but may not be too reliable since only 3 job titles were included.

*Per Cent of all job titles on this occupational level as shown at bottom of table.

For the managerial level, competencies that were ranked highest were customer relations, buying, salesmanship and financing, all in the business and distributive

grouping. However, competencies under agri-business also received high ranking.

Supervisory level employees were most concerned with salesmanship, credit instruments, accounting, financing, and advertising.

For personnel on the sales level, customer relations, salesmanship, bookkeeping and displaying were of primary importance.

Employees on the clerical level required skills in customer relations, bookkeeping, and records and analysis more than in other areas.

For employees in job titles on the skilled, semi-skilled, and unskilled levels competencies most necessary were customer relations, salesmanship, power equipment and tractors, auto mechanics and mechanical operation and repair.

Averages of all competencies within the various categories resulted in the following ranking in order of most importance; Supporting Business and Distributive, 2.54; Agri-business Management, 2.08; Agricultural Mechanics, 1.82; Supporting Trade and Industrial, 1.71; Soil Science, 1.69; Animal Science, 1.58; and Plant Science, 1.58.

Highest ranking single competency was salesmanship, 3.13, followed by customer relations, 3.04. Next in order were bookkeeping, 2.87; buying, 2.66 and accounting, 2.62.

Also included in the top twenty competencies in the following order were: financing, credit instruments, records and analysis, displaying, taxes, insurances, electricity, machinery and equipment, advertising, government regulations, auto mechanics, machinery operation and repair, welding, economic principles, and marketing. Management training ranked twenty-first.

Lowest ranking competencies were: soil testing, soil and water management, plant breeding, metallurgy, artificial insemination,

processing poultry products, forestry, and mechanical drafting. This may indicate the technical nature of those competencies which makes them of little general interest.

It appears that a training course for personnel on professional, technical and managerial levels emphasizing their particular job area might be beneficial. Efforts could include elevator management and soils and fertilizer clinics for the purpose of increasing job potential. For other personnel, regular refresher courses or clinics in specific job areas might be held.

The employers interviewed were at times vague as to job titles and the competencies required for each job title. As managers pointed out, in a small business in a rural area, there is often an overlap of duties with employers assuming different duties at different times. Managers also often assumed many duties not implied by their job title. Statements were occasionally made indicating that if trained personnel were available they would be given priority for future employment. It may be possible that many of the employees now classified as skilled, semi-skilled and unskilled could move to the technical level or other levels with more and better training. There seemed to be some confusion as to job skill level when compared with the degree of knowledge and skill the manager desired for the personnel. Whether the present employee in actuality possessed the skill desired seemed questionable in many instances. Management training was often desired by the manager although he had received only informal on the job training. Expansion of business enterprises would permit delineation of jobs with fewer duties for each employee which might be conducive to the establishment of specific training programs.

With the very high emphasis placed on salesmanship and

customer relations and the related competencies of bookkeeping, buying and accounting, the importance of a high degree of skill in dealing with the public becomes apparent. This may imply the need for personal skills and attitudes. Such training might be included in a course that combined business and distributive education with the specific kinds of agricultural competencies required for the various job titles.

A composite summary of all job titles and the degree of employee competency required in each area is found in Table XXVII.

14. Seasonality of Part-time Jobs and Length of Employment.

Table XXVIII gives information concerning the time of year and length of part-time employment. No part-time employment was indicated for 308 job titles and no response was given on length of employment for 315 job titles.

For the 33 job titles indicating part-time employment, the largest number, 14, were non-seasonal. Five indicated summer employment and 2 each indicated spring and winter. One each was reported for fall, growing season, and harvest.

The average length of employment was 4.4 months, ranging from 1 month to 9 months. Ten job titles indicated part-time employment for 3 months.

The findings indicate very little part-time employee opportunities. However, some interviewees stated that it was very difficult to find adequately trained personnel to fill part-time jobs and that it was difficult to train them on-the-job because of the short duration of employment.

15. Requirements for Union Membership, License or Certificate

Responses concerning requirements for all job titles for union

16. Education Desired to Advance.

The kind of training that would be desirable for advancement for personnel in all job titles is given in Table XXX. For employees in the greatest number of job titles, managers indicated a desire for short-courses, 233. Next highest preferenced for was on-the-job training, 168, followed by training offered by public schools, 102, and training offered by agricultural colleges, 49.

TABLE XXX

EDUCATION DESIRED TO ADVANCE FOR EMPLOYEES IN ALL JOB TITLES AS INDICATED BY EMPLOYER

| Type of Education | No. Job Titles |
|---|---|
| Short Course | 233 |
| On-the-job-Training | 168 |
| Public School | 102 |
| Agricultural College | 49 |

CHAPTER IV

## SUMMARY AND CONCLUSION

### I. SUMMARY

In Todd County, as elsewhere, vocational agriculture education has stressed farm oriented instruction on the secondary level and has only recently expanded into intensive farm management for area farmers. During the past 3 years a farm management program under the Manpower Development and Training Act of 1962 has been offered in 6 communities through the Area Vocational-Technical School at Staples. In 1963 the first full year was offered in the Staples area. In 1965 the second class was added. Later in 1965 and 1966 the program was expanded to include six classes in six communities.

Todd County is located in central Minnesota and is characterized by wide variation in soil types and topography with farms averaging 170 acres in size in 1959.

The county is largely rural, 88.4 per cent of the total population of 23,119, and has had much out-migration which resulted in a decrease of 2,300 in population from 1950 to 1960.

Farm numbers have decreased but size of farm and of farm business has increased as farmers are able to handle more acres due to technological developments.

Agriculture is still the primary enterprise with the major income from dairy. Also important are feeder pigs and hay. There is

some increase in the beef industry. Most crops are used for feed.

Business and industrial resources include dairy products processing plants, a printing firm, a clothing factory, a box factory, a meat packing plant and an optical lenses plant in the process of locating in the county. There is no major trading center, but rather trade is shared by a number of villages and towns both in and surrounding the county.

In addition to increased proficiency on the farm, technology has resulted in many jobs that were originally performed on the farm now being performed off the farm. The off-farm task migration has formed the basis of a number of off-farm occupations that now comprise a large segment of the economy. Most farm youth and their parents overlook the opportunities in these ag-related occupations where a farm background would be an asset. In 1959, 48 per cent of the total labor force in Todd County were employed in farming. At the present time the area is still based primarily on farming and ag-related business enterprises.

There is a greatly diminished demand for unskilled labor, with farmers now relying on specialized services as the need arises.

There has been much effort to determine changes that need to be made to meet the educational needs in agriculture as a result of technological developments in Minnesota, California and elsewhere. New legislation and new dimensions in vocational agriculture have stimulated the development of pilot programs. As a result, guidance counselors are being challenged to help students see potential opportunities in ag-related jobs.

The purpose of the study was to obtain information regarding

off-farm agricultural occupations in Todd County, Minnesota to be used in developing training programs for such occupations. The information obtained was also used in a ten county study including Anoka, Fillmore, Kandiyohi, and Yellow Medicine Counties and five other counties.

The source of data was personal interview of the managers of all agriculturally related businesses in Todd County. An off-farm agriculture business was considered any business providing marketing, processing, distribution or services to production agriculture. One hundred seventy-seven firms were interviewed. These firms had 571 employees with 341 job titles related to agriculture. The largest number of firms had retailing as a major function, 103, and the next highest was service, 51.

One hundred and fifty-seven firms had more than 50 per cent of their gross income agriculturally oriented.

Men exceeded women needing ag competencies at all levels except clerical.

Over half of the businesses were under the occupational family of mechanized agriculture and the next highest grouping was under agriculture service.

The highest number of employees were on the managerial level and the next highest on the unskilled level with less than half the number found on the managerial level.

Personal interviews greatly outranked all other sources of employment. The State Employment Service, Public Schools and Area Vocational-Technical Schools were used very little by employers to fill positions.

The most frequent educational level for entrance into job titles was high school completion. Sixty per cent of all job titles required

a high school diploma for entrance. Technical training was required for 13 per cent of the job titles. Level of education for entrance was related to opportunity for advancement and to the level of starting and maximum salaries.

Only a few job titles were found on some levels, making them too few in number to draw valid conclusions.

Highest average starting salary, $540, and the highest average maximum salary, $667, was found on the professional level. Lowest average starting salary was found on the semi-skilled level, $286. Full-time average maximum salary was $413 and for part-time workers, $238.

For twenty-two and eight tenths per cent of the employees in all job titles the managers interviewed considered a farm background essential and for 83.1 per cent it was considered highly desirable.

Of all full-time job titles, for 24.8 per cent previous work experience was considered essential and for 71.2 per cent it was considered desirable. High school Vo-Ag training was considered desirable for 69 per cent but it was considered essential for only 1 per cent. A college degree in agriculture was considered essential for 5 per cent of the employees.

Age requirements were related to type and level of job, with the most frequently preferred age being 35-44, for 49 per cent of all job titles. A minimum age of 19-24 was acceptable for 66.4 per cent of all job titles if workers met other qualifications.

The largest number of new jobs anticipated in the next 5 years is on the sales and skilled levels, 9 each, and on the managerial level, 7. There were only 41 new employees anticipated in the next 5 years inclusive of all job levels.

Few training opportunities are available for employees. Industry provided the majority of all training, mostly as informal on-the-job training.

Business problems are common to all job title levels, with the managerial level having the highest degree of involvement. Problems of most concern are handling money, keeping records and accounts, and inventory.

In the area of animal husbandry a knowledge of dairy is most important and for crops a knowledge of corn is most important. In the soils area interviewees ranked a knowledge of fertilizers and chemicals as being of most important for employees. Other kinds of knowledge that received a high ranking included beef, swine, legumes and grasses.

Professional job titles required knowledge in all areas and managerial and sales levels also required a wide range. Only 3 job titles were reported on the technical level. These required specific knowledge of either livestock, crops, or soils. In general the kind of knowledge and skill required reflects the type of farming in the county and indicates the need for continuous training for personnel to keep abreast of technological developments.

In ranking competencies required in major areas, supporting business and distributive competencies were of most importance to all job titles, being required by employees in 91 per cent of the job titles. Agriculture business management ranked highest by the sales and managerial levels.

In degree of competencies required, it was found that salesmanship and customer relations were rated highest for employees in all job titles. Other business competencies were also very important.

All competencies were rated comparatively high for professional level positions. On the technical level specific skills were required in a specific area. Nearly all competencies, especially those in the area of business and distributive and agri-business management, were of importance to managerial personnel. Skilled, semi-skilled and unskilled employees were in need of competencies in customer relations, salesmahship, power equipment and tractors, auto mechanics and mechanical operation and repair.

Managers indicated part-time employment for 33 job titles with 4.4 months as average length of employment.

Some type of license or certificate is required for employees in 115 job titles. Only 2 job titles required union membership.

In regard to the type of education desired to advance for most job titles short courses were preferred with on-the-job training the next most frequent preference.

## II. CONCLUSIONS

Agriculture and ag-related business is still the primary basis of the economy in Todd County and the surrounding area.

At the present time farm management and agri-business training opportunities while much improved in recent years are still inadequate.

Many students with farm backgrounds are unaware of employment opportunities in agri-business positions. Employers are not well acquainted with present and proposed training programs and make little use of public schools or Area Vocational-Technical Schools as a source for employees.

Job titles in agri-business indicate a need for many agricultural competencies but employees often lack these competencies and have little opportunity to acquire them.

The largest number of job titles in Todd County are on the managerial level, 43.4 per cent of all job titles. These job titles cover the whole range of activities in the firm. A desire for management and supervisory training was indicated by most job titles on the managerial level.

Business problems were common to all job titles.

III. RECOMMENDATIONS

Considering the data in this study as discussed in the above Summary and Conclusions, the author recommends the following:

1. That the agri-business management courses now offered in some of the Minnesota Area Vocational-Technical Schools be expanded and intensified to:

a. Attract more students with a farm background and train them for ag-related jobs both in the area and to qualify them for better jobs in larger communities where many are now migrating.

b. Extended to a 2 year course for some specialized curriculums, such as laboratory-technicians training to provide better service to farmers for feed testing, soil testing and other tests that may be needed.

c. Offer training for entrance into levels such as managerial, technical, supervisory and sales with high starting salary and salary potential.

d. Include work experience as part of the training program and provide in-service training opportunities for managers and employees in agri-business firms in the area.

e. Tailor the training courses to meet the desired competencies as indicated by the business, including both

business and agriculture. More training courses could also be offered for other occupations such as jobs that are related to homemaking which have moved out of the home.

f. Prepare graduates for a choice of several jobs with similar requirements.

g. Retrain older workers to upgrade skills according to area needs and seek better employment opportunities for them.

2. A more definite and consistent plan be developed for informing potential students and their parents of present and proposed training opportunities and employment possibilities.

3. A placement procedure be developed to enable employers to hire employees best suited for positions available and to give graduates the widest choice possible.

4. That continued and increased emphasis be placed on adult farm management programs since although the study did show need for more attention to ag-related business training, these are based on successful farming operations. The author feels that production agriculture is still the main enterprise in the county. For this reason and also because the number of job opportunities in off-farm agriculture is limited, the adult farm management programs in the county should be expanded to reach the greatest number of farmers, with increased emphasis on home management.

5. For ag-related businesses to have a firm basis in successful farming operations in the community, programs should be developed to assist those wishing to enter farming. Some communities in the county have established committees for developing such programs. Efforts

might be expanded to other communities with possibly a central county agency to coordinate the local committees. A current list of number of productive farms available, availability of financial assistance, and sources of livestock and machinery might be included in the activities of such committees. Efforts of agri-business oriented courses could be intensified along this line at Minnesota Area Vocational-Technical Schools.

Further recommendations based on observations of the author in conducting this study are:

1. Improved opportunities are needed for school administrators, counselors, clergy and other professionals in the area to understand changes in agriculture and ag-related businesses.

2. More research should be conducted concerning small businesses in rural areas as to success factors and a method of training and analysis be developed similar to that used for farm business records.

3. Reasons for discrimination against older workers in hiring of employees should be investigated to discover whether in reality they are justified. Comparative studies of various age groups should be conducted to determine relative job performance.

4. The author further recommends that additional studies be made. Because of the size and scope of this study, it was impracticable to emphasize stated specific purposes listed in Chapter I as fully as would be desirable.

## APPENDIX II

## OCCUPATIONAL LEVEL JOB TITLE CLASSIFICATION

The following classification was used for occupational level of job titles. There is often an overlap of duties of employees and as a result some confusion as to occupational level of job titles due to the nature of many small businesses in the county. Job titles and occupational level are as given by the employers interviewed. Only different job titles are listed with the number of times each job title was given in parentheses. There was repetition of the same job title by different managers so that the total of different job titles as tabulated in tables in the study does not coincide with that listed in the Appendix unless all job titles on an occupational level are considered.

I. Professional

Agriculture Engineer (1)
County Agricultural Agent (1)
Assistant Agricultural Agent (1)
County Home Agent (1)
Veterinarian (4)
Vo-Ag Instructor (8)
Ag Representative - Bank (1)
Teacher (1)
FHA - Co-Supervisor (1)
Pharmacist (1)
Bank Cashier (2)
Bank - Vice-President (1)

II. Technical

Artificial Inseminator (1)
Parts Man (1)
Sales - Technician (1)

III. Managerial

Bank President (2)
Bank Vice-President (1)
Editor (2)
Assistant Manager (3)
Cashier (1)
Assistant Cashier (1)
Manager (52)
Office Manager (2)
Owner - Manager (61)
Co-Owner - Manager (21)
Manager - Hired (2)

IV. Supervisory

Supervisor - Superintendent (2)

Assistant Manager (2)

Real Estate Broker (1)

V. Sales

Insurance Agent (3)

Clerk (1)

Sales Clerk (6)

Sales Manager (1)

Salesman (12)

Dealer (1)

Hardware Buyer - Sales Clerk (2)

Salesman - Mechanic (1)

Salesman - Parts Man (1)

Driver - Salesman (2)

Sales - Service Man (2)

Auctioneer (1)

VI. Clerical

Bookkeeper (11)

Clerical Workers (12)

Stenographers (7)

Tax Consultant (6)

Assistant Cashier (1)

Teller (1)

Loan Clerk (1)

Office Manager (1)

VII. Skilled

Fieldman (2)

Auctioneer (1)

Mill Helper (1)

Butcher (1)

Blacksmith (1)

Carpenter (2)

Farm Implement Mechanic (1)

Mechanic (12)

Laborer (2)

Serviceman (1)

Welder (1)

Truck Drivers (5)

Sausage Maker (1)

Creamery Helper (1)

Wheel Alignment Man (1)

Body and Paint Man (2)

Dairy Retail Helpers (1)

Laboratory Technician (1)

Feed Salesman (1)

Buttermaker (1)

Assistant Buttermaker (1)

Parts Man (1)

General Helpers (2)

Plumbers (2)

Set-up Man (1)

Electrician (1)

VIII. Semi-skilled

Bottling Machine Operator (1)

Bulk Tank Truck Driver (2)

Meat Cutter (1)

Mechanic (1)

Mechanic Assistant (1)

Mill Operator (1)

Parts Man (1)

Feed Mill Employee (3)

Truck Driver (3)

Farm Hands and Helpers (1)

Radio Announcer (1)

Grinder-Mixer Operator (1)

Assistant Store Manager (1)

Laborer (2)

Creamery Helper (3)

Bulk Delivery Man (2)

Equipment Installer (1)

Butcher (1)

Meat Wrapper (2)

Machinery Assembler (1)

Station Repairman (1)

IX. Unskilled

Delivery Man (1)

Laborer (4)

General Help (3)

Installation Helper (1)

Mill Laborer (1)

Truck Drivers (1)

ERIC

The Delaware Occupational Research Coordinating Unit (RCU) has compiled, as a service to local schools, a listing of selected research studies in the field of occupational education and related areas which have been reported in "Research in Education," a publication of the ERIC System. Each of approximately 125 studies listed is available on microfiche cards at the RCU office. Complete bibliographic data and the ERIC document number are given for each reference included. Publication dates are from 1959 through 1966. Each of the documents contains the final report of a research project funded under the Vocational Education Act of 1963. The dissemination of this information is intended to (1) provide the schools with a source of up-to-date information on developments in the field of occupational education, (2) provide data to substantiate changes that help to improve programs at the local school level, and (3) provide samples of written research documents that would assist local schools in writing research proposals. BIBLIOGRAPHY OF E.R.I.C. MICROFICHE FILM CARDS ON FILE WITH THE

Delaware Occupational Research Coordinating Unit

This listing represents the beginning of our collection of selected research studies in the field of occupational education and related areas. These documents contain the final reports of research projects funded under the Vocational Education Act of 1963.

It is the intent of this project to provide a service to the local schools. Through the dissemination of this information the purposes intended are:

1. To provide the schools with a source of up-to-date information on developments in the field of occupational education.

2. To provide data to substantiate changes that help to improve programs at the local level.

3. To provide samples of written research documents that would assist local schools in writing research proposals.

## - THE E.R.I.C. SYSTEM -

The E.R.I.C. System (Educational Research Information Center) under the sponsorship of the U. S. Office of Education is a nationwide information collection and dissemination project. There are 13 specialized clearinghouses that make up the ERIC System. Most of our efforts are concerned with the ERIC Clearinghouse on Vocational and Technical Education located at the Ohio State University. For your information the other ERIC Clearinghouses* listed by area of concern include:

The Disadvantaged

Junior Colleges

Exceptional Children

Small Schools and Rural Compensary Education

Linguistics and Uncommonly Taught Languages

Reading

Counseling and Guidance

Science Education

Teaching of Foreign Languages

School Personnel

Education Administration

Library on Adult and Continuing Education

*For a detailed listing of these Clearinghouses see page iv.

## - HOW TO USE IT -

In order to keep the local schools and other interested persons abreast of the research in progress, the U. S. Office of Education started publication in November, 1966 of a monthly catalog "Research in Education". This listing provides resumes of completed research reports and research in progress. The bibliography presented here represents selected research studies ordered by the Delaware Occupational Research Coordinating Unit from the Research in Education catalog. A complete set of these catalogs, Research in Education, is available for your reference through the Delaware O.R.C.U.

There will soon be available a Microfiche Reader in the O.R.C.U. Office. This will provide an opportunity for interested persons to preview or read entire studies that are of an interest to them. We encourage school personnel to make use of this reference service.

The Office of Research and Publications, under the direction of Dr. Wilmer E. Wise, has a complete microfiche file of research reports concerning the disadvantaged. These research projects were funded under the Elementary and Secondary Act of 1965. The Office of Research and Publications also has available a Microfiche Reader-Printer. This machine is designed for viewing as well as the print-out of selected pages. This service is available to school personnel by making the necessary arrangements through Mrs. Julia Burris, Research Assistant for ESEA, Title I, Statistics (ext. 489) in that office. The catalog listings concerning the disadvantaged have been distributed through Dr. Wise's office and are available in the local school districts for your reference.

A microfiche is a 4" x 6" film card that contains up to 60 miniaturized pages of text. Persons interested in ordering their own microfiche film cards (MF) or hard copies (HC) of completed reports may order such through the ERIC Document Reproduction Service, if interested see page iii.

Local schools are welcome to subscribe to this catalog, if interested see page iv.

## MORE TO COME . . .

These are to date the ERIC Research Reports on Vocational and Technical and Related Occupational Education Programs available for your reference. As our microfiche file is increased, we will mail out supplemental listings to you.

The prime function of this project is to provide a service to the local schools. We welcome your suggestions as to how we can more effectively meet your needs in the area of occupational education.

RESEARCH IN EDUCATION

Subscription Rate: Published 12 times a year; $11 per year, single copy $1.

Send check or money order to:

Superintendent of Documents
U. S. Government Printing Office
Washington, D. C. 20402

REPRODUCTION SERVICE

ERIC Document Reproduction Service
Bell & Howell Company
1700 Shaw Avenue
Cleveland, Ohio 44112

Orders are made by listing the ED numbers (ERIC Document) of reports wanted and noting whether Microfiche cards (MF) or Hard Copy (HC) of the reports are desired. For the specific costs involved, refer to the catalog.

RCU Staff Study.

Kansas Vocational Education Research Coordinating Unit, Topeka
MF AVAILABLE IN VT-ERIC SET.
Pub Date - Dec67 22p.

*RESEARCH COORDINATING UNITS; *PROFESSIONAL PERSONNEL; *NATIONAL SURVEYS; NONPROFESSIONAL PERSONNEL; EDUCATIONAL BACKGROUND; EMPLOYMENT EXPERIENCE

The Director of the Kansas Research Coordinating Unit (RCU) mailed an instrument to each of the 44 RCU's to gather information relevant to RCU staffing patterns. The major interest concerned professional staff positions although data was obtained for nonprofessional staff positions as well. Instruments were returned from 37 (84 percent) of the RCU's. The instrument covered the following items for each staff position: (1) educational background, (2) job title, (3) percent of time devoted to RCU, (4) nature of work other than RCU, (5) years with RCU in this state, (6) years with other state RCU's, (7) highest educational degree held, (8) annual salary, and (9) years experience in education. Some findings were: (1) 29 of the RCU's had full-time directors, (2) 23 of the 33 directors responding to the item had either Ph.D. or Ed.D. degrees, (3) 14 of 34 responding had an annual salary between $12,500 and $14,999, and 13 had an annual salary over $15,000, (4) 11 had an agricultural education background, and (5) the average number of years of experience in education was 16.75. The data is presented in tabular form by position and by RCU. A copy of the cover letter and the instrument used are included. (ET)

# RCU STAFF STUDY

## PURPOSE

To find out what positions occur in Research Coordinating Units, one could refer to various RCU quarterly and annual reports. After considerable time and effort, a rather limited amount of information could be obtained.

In an effort to assemble more complete data that would prove helpful in staffing the Kansas Vocational Education Research Coordinating Unit, this study was undertaken. The major interest concerned professional staff positions. However, data was obtained for both the professional and non-professional staff positions.

## METHOD

A mailed instrument was used to gather relevant information from each RCU. Information requested from the director of each unit included names of positions in use, educational background for the person in each position, work load, years with RCU, amount of education, salary range, and years of experience in education. A copy of the cover letter and instrument used in the study are included in the appendix.

## FINDINGS

Instruments were returned from 37 (84.0 per cent) of the 44 RCUs. The tables, which follow, have been designed to present the findings without additional explanation. Four tables have been used. By name they are: Table I - Information Concerning RCU Professional Positions (sub-divided into 16 parts); Table II - Professional Staff Positions by RCUs; Table III - Information Concerning RCU Non-Professional Positions (divided into 7 parts); Table IV - Non-Professional Staff Positions by RCUs.

# APPENDIX

August 9, 1967

The enclosed instrument has been designed for the purpose of determining how best to suggest future RCU staffing in Kansas. The proposal called for a director, an assistant director, a secretary, and a file clerk.

We have experienced difficulty in filling positions, mainly because of the ceilings placed on job titles by the State Finance Council. This personnel group reviews all tentative positions for organizations and decides what salaries will be paid for the job described.

We are quite interested in developing the Kansas RCU so it compares favorably with those in other states. The survey appears to be a common, though overworked, procedure for securing information pertinent to a problem.

I trust you will not consider some of the items too personal. We would like to know what positions have been provided for your RCU - if unfilled or for future use, please note with reference to the last four columns on the instrument, use the numbers provided in the key at the bottom of the page, e. g., for annual salary enter the number "3" instead of $6,500. From the composite provided by the research coordinating units, we can determine an average size unit, its professional status, and salary ranges for the positions.

Following the summary of returns, a copy of the study will be mailed to you, according to the usual procedure. Your early attention will be appreciated.

Sincerely yours,

George A. Robinson
Director, Kansas RCU

*AGRICULTURAL OCCUPATIONS; *EMPLOYMENT QUALIFICATIONS; *OCCUPATIONAL INFORMATION

Approximately 23 million people in the United States are employed in the agriculture industry--7 million in farming and ranching, 6 million in agricultural supplies and services, and 10 million in processing and distribution. Qualifications for an agricultural occupation include an interest in dealing with plants or animals, as much formal education as possible, and desirable personal qualities. Agricultural occupations are available in the areas of business, communications, conservation, education, industry, research, service, and farming and may be located in cities or towns, on farms, or in other countries. Typical occupational families offering jobs are agricultural production, machinery sales and service, supplies and equipment, dairy manufacturing and processing, livestock and crops marketing and processing, livestock and poultry industry, soil conservation and forestry, wildlife and recreation, ornamental horticulture, and farm and agriculture service. High school programs in agricultural education cover agricultural business, agricultural mechanics, conservation and forestry, farm operation and management, and ornamental horticulture. Advanced study is offered in technical programs and in college programs leading to a degree. (BS)

# CAREERS in AGRICULTURE

*A Guide for High School Students*

by Joe P. Bail

## WHAT IS AGRICULTURE?

Agriculture is generally thought of as the production of plants and animals or as farm work. Although it is true that farming itself is the core of agriculture, the scope of agricultural activities also includes businesses and industries that provide materials and services to the farmer and that process, market, and distribute agricultural products to the consumer. Agriculture, then, touches the life of every one of us to some degree. The food we eat, the clothes we wear, the homes in which we live are all products of agricultural resources.

## SCOPE OF THE AGRICULTURAL INDUSTRY

In the United States. Agricultural production and agricultural industry are found throughout the nation. Even though certain areas may be noted for the production of specific crops or livestock, the industries serving these specific products may be located anywhere. Estimates of the number of workers in occupations which require competence in agriculture vary greatly. The scope of the agricultural industry may be indicated by the following figures.

**Scope of the Agricultural Industry in the United States in Number of Workers, Value of Product, and Type of Service**

| Type of Service | No. and % of Workers | | Value of Product in Dollars |
|---|---|---|---|
| | No. | % | |
| Farming and Ranching | 7 million | 30.4 | 30 billion |
| Agricultural Supplies and Services | 6 million | 26.0 | 16 billion |
| Processing and Distributing | 10 million | 43.6 | 70 billion |
| Total | 23 million | 100.0 | 116 billion |

These figures indicate that nearly one worker in three in our country today is involved in agriculture or in services related to agriculture.

In New York. Agriculture is an important industry in the state. Actual agricultural production has increased greatly even though the number of farms and total acreage used in producing food has actually decreased. Agricultural specialties, such as the production of greenhouse and nursery crops, have become increasingly important. New York is fortunate in having all of the major crop and livestock industries represented in its agriculture.

One way to measure the extent of the agricultural industry is by the number of farms and the value of the gross farm income. Of the 80,000 farms in New York, approximately half may be classified as commercial, providing incomes of over $2500 per year. The total farm income for the state approaches one billion dollars a year. In addition, it is estimated that there are approximately 70,000 firms that assemble, process, or distribute agricultural products. Another 2500 firms supply the farmer with items needed for production. These include approximately 650 agricultural equipment centers and 900 retail outlets supplying basic agricultural products, such as feed, seed, fertilizers, lime, and insecticides. Like farming itself, businesses that serve agriculture are becoming bigger and more specialized. Agricultural cooperatives in New York are an important segment of this group. Many state and national agricultural agencies and organizations also have their headquarters within the state.

## QUALIFICATIONS FOR AN AGRICULTURAL OCCUPATION

INTEREST. Anyone interested in a career that deals with either plants or animals should certainly explore the various agricultural occupations—not necessarily only those that are carried out on the farm. Many jobs in agriculture include working with people, ideas, or machines, and not only with growing crops or animals. Agricultural occupations may deal with growing, marketing, or processing agricultural products, or they may deal with selling, servicing, teaching, or writing about such products. Training in agriculture alone does not qualify one for these jobs. But a knowledge of agriculture, coupled with competence in the chosen field of endeavor, greatly enhances chances for success and satisfaction in the field.

EDUCATION. Every student should obtain as much formal education as possible, regardless of the level of job he aspires to fulfill. This means remaining in school and trying to do well in all subjects, not only in those related to agriculture. The ability to read and write—that is, to communicate—is essential in today's world. A reasonable knowledge of mathematics and of scientific and technical processes is basic to nearly all the occupations we are considering. Some specific reasons for being graduated from high school are:

(1) *Job opportunities will be greater.* Many surveys show that jobs for which there are not enough trained personnel almost all require a high-school education. Every day more jobs are added to the list of those requiring high-school training.

(2) *Specific job opportunities will be better.* Technical training and education are needed to handle the complex equipment and machinery in industry, business, and farming. To provide a job for the average farm worker over $17,000 must be invested in the first place. The average industrial worker has about $15,000 back of him invested in equipment. Employers are not willing to trust their investments to workers who have dropped out of school.

(3) *Opportunities to advance will be greater.* Minimum skills and abilities are needed to advance on the job. It is assumed that a school dropout does not have the necessary knowledge to advance to positions of greater responsibility. Work for the unskilled and low-skilled is rapidly disappearing because of advances in science and technology.

(4) *Lifetime earnings will be enhanced.* Each year a student remains in school enhances his earning power. Based on a working life-span of 40 years, total earnings of the high-school graduate will exceed those of the dropout by at least $35,000. Each additional year of education past the high-school level adds greatly to possible future income.

(5) *Opportunity for specialized or post-graduate education will be improved.* More and more technical or specialized schools are requiring high-school graduation for admission. Many apprenticeship programs require a high-school diploma or equivalent. Opportunities in the Armed Forces for advancement or specialized training will also likely require 12 years of schooling. Chances of acceptance by any kind of postgraduate educational program will largely be determined by high-school performance. Educational achievement, regardless of the level at which it ends, determines to a great extent the possibility to lead a full and rewarding life.

PERSONAL QUALITIES. The ability to get along with people, to give full measure in terms of work output, to be receptive to changes and suggestions for improvement all help to make the desirable worker. One's personal strength of character should be drawn upon to aid in determining suitable "kinds" of work. In addition, those qualities or traits needing improvement should be constantly kept in mind and sincere efforts made to improve them.

In order to judge personal qualifications against the requirements of a specific occupation, students are urged to use the worksheets appearing in Cornell Miscellaneous Bulletin 45, *Choosing An Occupation—A Guide for High School Students.* These forms are entitled "Self-Inventory Worksheet" and "Worksheet for Studying An Occupation." The bulletin can be secured from the Mailing Room, Stone Hall, Cornell University.

## TYPES OF AGRICULTURAL OCCUPATIONS

Agricultural occupations provide jobs at all levels. They range from the professional to technical, from managerial to sales and clerical, from skilled and semi-skilled to unskilled. A few examples of each classification, based upon the type of service performed, are presented below.

| Service | Typical Job | Employer |
|---|---|---|
| Business | Retail salesclerk | Private companies |
| | Fieldman | Private companies |
| | Credit representative | Banks, cooperatives and others |
| | Agricultural salesman | Feed, fertilizer, machinery dealers |
| Communications | Agricultural editor | Farm magazines, colleges, industry |
| | Agricultural photographer | Farm magazines, colleges, industry |
| | Agricultural newscaster | Radio and TV stations |
| | Agricultural reporter | Newspapers and farm magazines |
| Conservation | Conservation aide | State and federal agencies |
| | Biological technician | State and federal agencies |
| | Forester | Private business, state and federal agencies |
| | Game protector | Private business, state and federal agencies |
| Education | Teacher of agriculture | Local boards of education |
| | County agr. or 4-H agent | Extension service |
| | Agr. educ. specialist | Colleges, State Dept. of Education, others |
| | College teacher of agr. | Colleges, institutes, junior colleges |
| Industry | Dairy-plant worker | Dairy manufacturing companies |
| | Feed-plant supervisor | Private feed companies and co-ops |
| | Inspector or analyst | Feed, fertilizer, and chemical companies and governmental agencies |
| | Machinery serviceman | Agricultural machinery companies |
| Research | Agricultural chemist | Feed, fertilizer, and insecticide companies |
| | Agricultural engineer | Machinery and implement companies |
| | College professor | Colleges and universities |
| | Plant breeder | USDA, colleges, and private companies |
| Service | Veterinarian | Private practice, state and federal agencies |
| | Inspector of agr. prod. | State and federal agencies, marketing organizations |
| | Technician | Artificial breeding organizations, breed organizations |
| | Fieldman | Breed associations, cooperatives |
| Farming | Farm operator | Self-employed |
| | Farm manager | Commercial farms, institutions, and others |
| | Farm laborer | Commercial farms |
| | Custom operator | Self-employed |

## LOCATION OF AGRICULTURAL OCCUPATIONS

On the Farm. Commercial farming and ranching in the United States employ approximately seven million workers. Of this number, about one-half are farm owners and operators and the other half are hired farm workers.

Farm operators own and manage their own businesses. Although the amount varies greatly throughout the United States, considerable capital is necessary to become a farm owner. Normally, a business arrangement involving a share of or regular return from the business, to be increased at regular periods, is the avenue to farm ownership for the young person. Developing equity through livestock, machinery, or land ownership in an educational program, such as vocational agricultural enterprises or 4-H Club projects, is still another way. Earnings of off-farm jobs

may also be used to get the initial start in a farming business. It is still possible today to become a farm owner, even though a great amount of money is required to establish a business that will provide an adequate income. Numerous sources of credit, including family help, are available.

Hired wage-workers on a farm perform many different tasks. They range from hand or stoop labor in harvesting to repairmen, tractor or truck drivers, machine operators, and supervisors. In a given season, one individual farm worker may be employed in several of the positions listed depending upon the level of his skills and the need for his service. The age of the individual is also likely to be reflected in the job held. A young worker is more likely to be employed in the hand-labor group unless he has had training or experience which qualifies him for increased responsibility. Low educational level is characteristic of the majority of workers who are paid wages or perform only those tasks requiring physical strength.

Local and state employment agencies and agricultural businesses, including farms, ranches, and specialized businesses such as nurseries, are sources of employment. School counselors may also know of work, either full or part-time, in farm jobs.

In Towns and Villages. Many of the businesses and services that provide items needed in farming are located in small towns and villages throughout the country. These include feed, seed, fertilizer, and machinery companies, marketing cooperatives, processing plants, and specialized services. Generally, these companies have positions for salesmen, clerical workers, skilled workers, and technicians to provide the goods and services needed by the producer. Agricultural knowledge coupled with business training is a prerequisite for many of these jobs.

In Cities. Large business and industrial concerns serving the agricultural sector of our economy are generally located in larger cities. Many technical and professional workers with agricultural knowledge and training are employed by these groups. They, of course, also employ many kinds of workers for whom training in agriculture is not necessary. In addition,

most public and private institutions that offer training in agriculture, conduct research, or disseminate information about agriculture are located in cities. Governmental agencies and educational institutions are among the leading employers of such people.

In Other Countries. A recent publication of the Peace Corps lists many agricultural occupations in which people are needed. Among these are teachers of agriculture at all levels, agronomists, conservationists, animal and plant specialists, rural-recreation and community-development workers. Some of these titles suggest that a four-year professional course in agriculture is necessary, but for others, membership in 4-H, FFA, or other agricultural experiences may qualify candidates. Many church groups need agricultural missionaries to work overseas. Governmental programs now under study need persons with agricultural or rural backgrounds to work in areas of our own country.

## SOME TYPICAL JOB TITLES

Some typical job titles in which agricultural competence is needed provide an indication of the extent of opportunities. The positions are grouped into major occupational families within agriculture and include jobs at most levels of work. All these job titles were found in New York State in a recent survey of agricultural occupations.

*Agricultural Production:* Farm operator or manager, farm supervisor, farm-equipment operator, farm laborer.

*Agricultural Machinery Sales and Service:* Agricultural engineer, agricultural technologist, mechanic, fieldman, salesman, parts manager, serviceman, welder.

*Agricultural Supplies and Equipment:* Manager of agricultural supply house, salesman, fieldman, bookkeeper, salesclerk, mechanic, equipment operator, parts manager.

*Dairy Manufacturing and Processing:* Manager, salesman, routeman, laboratory technician, cheesemaker, pasteurizer, milk inspector, bulkmilk truck driver.

*Livestock Marketing and Processing:* Manager, buyer, auctioneer, butcher, meat cutter, salesman, warehouseman, inspector.

*Livestock and Poultry Industry:* Manager, veterinarian, technician, sexer, egg grader, egg inspector, laboratory technician.

*Crops Marketing and Processing:* Manager, fieldman, salesman, grader, buyer, packer, mechanic, truck driver, produce man.

*Soil Conservation and Forestry:* Conservation aide, conservation technician, agronomist, soil scientist, lumberman, firewarden, logger, lumberjack, forester, forest ranger.

*Wildlife and Recreation:* Guide, park attendant, wildlife specialist, game biologist, camp or park manager, camp custodian, grounds keeper, camp counselor, salesman.

*Ornamental Horticulture:* Manager, salesman, arborist, tree pruner, groundsman, landscape aide, landscape architect, nurseryman, florist, lawnkeeper.

*Farm Service:* DHIA Supervisor, artificial inseminator, crop sprayer or duster, field supervisor (A. S. C. S.), lime or fertilizer spreader, mobile repairman.

*Agricultural Service:* Farm appraiser, farm credit representative, teacher of agriculture, county agent, 4-H Club agent, agricultural scientist, agricultural economist, journalist, reporter, farm placement advisor.

## OPPORTUNITIES FOR STUDYING AGRICULTURE

High School. At the high-school level, most agricultural instruction in the past was concerned with training for farming. The provisions of the Vocational Education Act of 1963 call for the establishment of courses for training in any agricultural occupation for which a need exists. Consequently, programs in agricultural education at the high-school level now cover five major areas: Agricultural Business, Agricultural Mechanics, Conservation and Forestry, Farm Operation and Management, and Ornamental Horticulture. The emergence of area vocational programs will create greater opportunity to study in these

fields for a larger number of students. Local school administrators and the officials of the Bureau of Agricultural Education, State Education Department, Albany, can answer questions concerning these programs.

Advanced Study. New York has an outstanding educational program in agriculture, offered at the Agricultural and Technical Colleges (formerly Agricultural and Technical Institutes) of the State University. Specialized technical programs as well as opportunity to transfer credits to a four-year college program are available. Typical programs include preparation for jobs in such areas as agricultural machinery and equipment, ornamental horticulture, animal industry, agricultural business, and food processing.

Courses and programs in other postgraduate institutions may provide training needed for entry into agricultural business and industry.

Each state has one or more land-grant institutions which offer instruction in agriculture leading to a college degree. In our state, the College of Agriculture at Cornell University offers such a program. The College of Forestry at Syracuse University offers professional training in forestry. Both of these institutions also offer programs that require less than four years and programs at the graduate level.

*NURSING; *MANPOWER NEEDS; *EDUCATIONAL RESOURCES; EMPLOYMENT STATISTICS; HEALTH OCCUPATIONS EDUCATION; NURSES; HEALTH PERSONNEL; INTERAGENCY COORDINATION; *STATE SURVEYS; *EDUCATIONAL PLANNING ILLINOIS

The main work of the Commission was done by seven standing committees representing nursing education and institutional, community health, mental health, occupational health, private duty, and office nursing. Fifty-four recommendations include increasing the number of baccalaureate programs from the present nine to 18-20 and of schools offering master's programs from four to six, establishing one doctoral program and a center for the study of community health services, improving faculty utilization by increasing enrollments and pooling faculty, initiating planning among university schools for specific contributions to be made by each, encouraging further guidance by the American Nurses' Association in developing roles and functions in specialized fields of nursing, and increasing salaries in recognition of other career opportunities, educational attainment,and experience. The following goals were adopted for 1980: increasing the total number of employed registered nurses from 33,613 to 58,000, the annual total of master's program graduates to 301, baccalaureate program graduates to 1,465, and associate degree and diploma program graduates to 2,374. The Commission further advocated an ongoing plan to implement its recommendations. An analysis of the present status of nursing in Illinois and a plan for a systematic appraoch to the development of nursing education involving community planning are treated in separate chapters. Detailed reports of the standing committes, including a nurse utilization study which presents a mathematical model for defining appropriate staffing patterns, will be available later. (JK)

January, 1968

# ILN-INA STATEMENT OF APPRECIATION

The idea of establishing an Illinois Study Commission on Nursing was implemented only three years ago. Significantly, it became an endeavor undertaken jointly by the Illinois League for Nursing and the Illinois Nurses' Association. As such it has set the tone for the cooperative undertaking its work represents.

Few satisfaction can equal that of witnessing the completion of a task as formidable and ambitious as that exemplified by this report. Few groups have met their charge as expertly in the face of multiple adversity as has the Illinois Study Commission on Nursing. We owe a large debt of gratitude to the Commission's chairman and members; to its Executive Committee, seven standing committees and the special committees; and to the staff. To the donors of money and services whose generosity made the Commission's work possible, and to all who cooperated and assisted in the various studies undertaken by the Commission, we give our warm thanks. Consultation services by staff of the Division of Nursing, U.S. Public Health Service, were generous and of inestimable value. They are deeply appreciated.

The recommendations presented herein are decisive for nursing's future in Illinois; their implementation would lead to the kind of future envisaged with pride by the nursing profession, a future which would offer the people of our state much deserved high-calibre nursing services, and which would unite us in a common effort toward the attainment of optimum health care for all.

This report offers a challenge and a responsibility: nurses, allied professionals and concerned citizens of our state, individually and through organizational activities, must see to it that these recommendations become translated into reality. It is a mammoth task which cannot be accomplished without the participation of every member of our two organizations. We are confident of support, both by our members and by our communities, and we know that together we shall succeed.

Mrs. Ingeborg G. Mauksch
President, ILN

Adeline M. Jorstad
President, INA

# FOREWORD

The Illinois Study Commission on Nursing and its work give testimony to the progress that can result from interprofessional planning and cooperation. The Commission was created in 1965 by the Illinois League for Nursing and the Illinois Nurses' Association, acting through their Coordinating Council. In 1963 the Illinois Hospital Association had called upon organized nursing to develop a master plan for nursing education in Illinois, pledging support, counsel, and "seed money." The nursing organizations, accepting the challenge, appointed a committee of nurses to design a feasible approach to the task, suggest the organization for its accomplishment, estimate the budget required, and appoint a finance committee to raise the $80,000 estimated to be needed.

The Coordinating Council of the two nursing organizations appealed successfully for advice and technical assistance from the Division of Nursing, Bureau of Health Manpower, Public Health Service, Department of Health, Education, and Welfare. The Boards of Directors of the two nursing organizations, acting jointly, appointed the Commission, specified its charge, assured financing of its work, and gave the Commission freedom and autonomy in carrying out its task and deciding upon its recommendations. The task of the Commission was detailed in the letter of appointment to each commissioner:

> "To document Illinois' present nursing personnel needs by assembling facts about budgeted positions filled and vacant in hospitals, nursing homes, health departments, visiting nurse services, schools, industrial plants, doctors' offices, etc.
>
> "To assess our resources for overcoming nursing shortages in relation to prospective candidates from the population, and in relation to costs, capacity and quality or types of nursing schools.
>
> "To analyze the effects of health service expansions and extensions which are planned and which are probable over the next fifteen years.
>
> "To develop a program of action based on the recommendations for changes which are found necessary and/or promising to meet 1980's forecasted needs for nursing services. This last is the main purpose of the entire endeavor."

The Commission, composed of 55 members widely representative of the professional and public groups concerned about the provision of adequate nursing care in Illinois, met for the first time in October, 1965 to consider its charge, organize itself, determine the procedure to be followed, and authorize staff and administrative arrangements. An Executive Committee, composed of the chairman of the

Commission; the executives of the Illinois Hospital Association, Illinois League for Nursing, and the Illinois Nurses' Association; one member elected at large from the Commission, and the chairmen of the several standing committees, was authorized and charged with direction of the effort. The main work of the Commission was done through the activities of seven standing committees: Institutional Nursing; Community Health Nursing; Mental Health Nursing; Occupational Health Nursing; Nursing in Doctors' Offices; Private Duty Nursing; Nursing Education. Each committee was chaired by a Commission member and composed of experts in the occupational area within the purview of that committee.

The Commission's work and its results would not have been possible without the dedicated efforts of many people. To each person who contributed in any way, we are grateful. Mrs. Ann Zercher, her finance committee, and the donors who committed funds and services to this study made the whole effort possible. Each member of the Commission and the organization with which he is affiliated was unfailingly generous with time, counsel, data, or anything else requested of him. Members of the standing committees have earned the admiration of all; theirs was the task of assessing the present, grasping the future, and designing the means through which we can hope to obtain the nursing services that the future will require. The chairmen of the standing committees provided superb leadership to their committees, supervised the committees' special studies, and wrote comprehensive reports for the Commission.

The staff of the Division of Nursing, Bureau of Health Manpower, USPHS, directed and assisted with data collection and analysis. Miss Helen Foerst has earned warm regard and gratitude from the entire Commission. The "background papers" she prepared can serve as models for other studies; her expertise and great talent were laid at the Commission's service without stint. Eugene Levine, Ph.D., chief of manpower analysis and resources of that Division, provided overall guidance and advice. The study of nurse utilization soon to be published was formulated, designed, and implemented under his guidance; it will be, we are confident, another in a long list of significant contributions he has made to the improvement of nursing care in the United States.

The Board of Directors of the Illinois League for Nursing came to the rescue when our project director resigned after five months. The Executive Director of the League, Mrs. Kathryn Bailey, became our project coordinator. Largely because of the devoted and persistent effort of Mrs. Bailey and the staff she directed - Mrs. Naomi Quigley, Miss Malvina Owens - was the work completed. In addition, the ILN was responsible for administration of the Commission funds, through services given by staff and the League's treasurer, Mr. George Sackheim. All have earned the gratitude of the Commission and of all who hoped for the successful completion of this effort. Consultation and professional services were available to the Commission through Odin W. Anderson, Ph.D., Associate Director, and

Mrs. Joanna Kravits, his assistant, the University of Chicago Center for Health Administration Studies. Mrs. Kravits assisted in preparation of the statistical materials presented in the Commission's report. Their counsel and constant desire to assist the Commission and its staff are deeply appreciated.

The resources of Illinois Nurses' Association were generously committed through Mrs. Anne Zimmerman, its Executive Director, who gave time and skilled assistance whenever needed.

The Illinois Hospital Association and its staff provided service and counsel far beyond their original pledge. Mr. David M. Kinzer, Executive Director, was unfailing in support of and active work with the Commission and its Executive Committee. Mrs. Margaret Ellsworth, IHA staff Consultant in Nursing, not only served as staff to the Institutional Nursing Committee but directed the nurse utilization study. The administrators and staffs of the thirty-one hospitals who undertook to study their nurse utilization under Mrs. Ellsworth's and Dr. Levine's direction have made a contribution of time and effort rarely equalled anywhere before.

The Commission presents this report in the hope that it will be considered everywhere in Illinois and that this effort and the action suggested will result in better nursing care for all Illinoisans in the decade to come.

Mary Kelly Mullane, R.N., Ph.D.
Chairman

# CHAPTER I

## PRIMARY CONCLUSIONS AND RECOMMENDATIONS

Our society is changing in many ways. It is growing. More people are living longer. Social ideals have changed. Health is now considered a human right. Economically our society is willing to spend more for health services. Politically our society is using government as a potent tool to develop solutions for its concerns for health. Technologically our society has the ability to change and shape health services to suit society's purposes as well as to make possible a move beyond "crisis care" to "comprehensive and balanced care."

Today's youth will be the future users of health care services. They are now the major source of health manpower. They are becoming more sophisticated socially, politically, economically, and intellectually. Today's youth has become more selective in determining its vocation and the means of preparing for it. The implications for nursing are profound.

While today's youth has been changing, nursing practice has also been changing. Change is reflected in the acceptance by nurses of increased patient care responsibilities, in more specialized nursing skills, in the delegation within nursing of responsibilities and skills previously considered to be the prerogative of the registered nurse, and in educational, administrative, supervisory and consultative responsibilities for which increased preparation is required.

The Standing Committees of the Illinois Study Commission on Nursing identified a broad range of problems and developed many recommendations for action to meet nursing needs in Illinois projected to 1980 for their various fields. They are included in detail in reports to be made available later.

The following conclusions and recommendations represent those broad areas of concern which were considered by the Commission to be of prime importance. They include areas where the public interest is primarily affected and where public understanding and support are needed if nursing in Illinois is to meet public expectations by 1980.

### Conclusions and Recommendations

I. There is a critical need for more nursing leadership in Illinois.

To achieve a viable balance now and in the future between what is available and what is required to meet needs for nursing services, nursing leadership must be strengthened and supported wholeheartedly by physicians, managers and purchasers of health services, and by an informed public. The

greatest single deterrent to quality education that will produce needed nursing leaders is the lack of available qualified faculty in baccalaureate and graduate programs.

Future leaders for nursing must be graduates of colleges and universities, and a good proportion of these graduates must be brought through master's programs. Illinois lags behind the nation in the proportion of its nurses who are educationally qualified for leadership. Only ten per cent of the active nurses in Illinois have baccalaureate degrees, and two per cent have master's degrees or higher. The proportion with master's degrees must be increased drastically just

Table 1. Highest education of registered nurses working in Illinois, by type of position, 1966.

| Position | Number of nurses with | | | | | | | | | | |

| Total | 29,613 | 88% | 3,244 | 10% | 490 | 1% | 220 | 1% | 46 | -- | 33,613 |

SOURCE: Licensure renewal questionnaire designed by American Nurses' Association. Data obtained from Illinois Department of Registration and Education for renewals in 1966.

to meet present effective demand for nurse administrators, teachers and clinical specialists and, obviously, this increase will result only if there is a considerable increase in numbers of nurses with baccalaureate degrees. Needs projected by almost all standing committees of the Commission document a much increased need by 1980. It was also clear in the Commission study that Illinois has superior resources in higher education and, particularly in the Chicago area, clinical resources for such education that match any in the United States. But many of our colleges and universities have not been convinced that they have a social responsibility to enter nursing education.

Recommended

1. That Illinois have by 1980, 18-20 schools that offer a baccalaureate degree in nursing (we have nine today) and six schools that offer master's programs either in education, administration or a clinical specialization in nursing (there are now four Illinois colleges offering eight specialized master's programs in nursing).

2. That at least one Illinois university offer a doctorate designed for nurses, to provide the faculty needed for master's programs and for the research on which improved nursing care depends. No Illinois university now offers such a doctorate.

3. That the State of Illinois support a center for the study of community health services and for the preparation of professionals for leadership in the various fields of community health. Nurses preparing for leadership positions in health services might well be enrolled in such an interdisciplinary program.

4. That sources of federal and state financial assistance adequate to make an appreciable difference in the number of nurses preparing for leadership positions in nursing be given urgent attention, recognizing the need for additional financial incentives.

5. That hospitals and other major employers of nurses be urged to increase financial support and provide the needed time to nurse employees who want to advance their educational qualifications.

6. That organized nursing in Illinois promote the principle of general subsidization of operating costs of the total educational enterprise, recognizing the lack of such assistance as a great deterrent to the expansion and development of baccalaureate and higher degree programs in nursing in private universities.

II. There is a similarly critical and overlapping need for a dramatic increase in the number of nurses qualified for faculty positions in schools of nursing in Illinois.

A master's degree is now considered the minimum qualification for teaching in institutions of higher learning and is rapidly acquiring a similar status in secondary schools. In this frame of reference, it is apparent that nursing education in Illinois has lagged far behind most other fields where advanced preparation is required, particularly since the closing of the master's program at the University of Chicago in 1959. The present pool of nursing faculty in Illinois schools of all types breaks down roughly into one-quarter with master's degrees, one-half with baccalaureate degrees, and the remaining one-quarter with only diploma or associate degree preparation.

Table 2. Number and percent distribution of full time nurse faculty[1] in professional and practical nurse programs by educational preparation, Illinois, selected years, 1958 - 1966.

| Educational preparation | 1958 | | 1960 | | 1964 | | 1966 | |
|---|---|---|---|---|---|---|---|---|
| | Number | Percent | Number | Percent | Number | Percent | Number | Percent |
| Doctorate | 1 | .1 | 4 | .4 | 12 | 1.2 | 15 | 1.4 |
| Master's degree | 183 | 20.0 | 208 | 22.8 | 276 | 26.7 | 274 | 26.6 |
| Baccalaureate | 447 | 48.7 | 432 | 47.3 | 515 | 49.9 | 516 | 49.8 |
| Diploma or AD | 286 | 31.2 | 269 | 29.5 | 230 | 22.2 | 231 | 22.2 |
| Total | 917 | 100.0 | 913 | 100.0 | 1,033 | 100.0 | 1,036[2] | 100.0 |

SOURCE: Illinois Department of Registration and Education, Statistical Information on the Registration and Education of Professional and Practical Nurses, selected years.

(1) Does not include faculty in cooperating agencies.

(2) In addition, 102 budgeted positions were reported vacant.

In 1958, Illinois graduated five per cent of the nurses in the U.S. who earned master's degrees. With the closing of the graduate program at the University of Chicago in 1959, this dropped dramatically and has not been regained.

Table 3. Illinois graduates from master's degree programs in nursing as a percent of U.S. graduates from master's degree programs in nursing, 1958 - 1966.

| Year | Number of graduates | | Illinois as a percent of U.S. |
|---|---|---|---|
| | Illinois | U.S. | |
| 1958 | 48 | 997 | 4.8% |
| 1960 | 7 | 1,197 | .5 |
| 1962 | 6 | 1,098 | .5 |
| 1964 | 13 | 1,282 | 1.0 |
| 1966 | 25 | 1,279 | 2.0 |

SOURCE: Facts About Nursing, American Nurses' Association selected years.

The increased responsibilities being delegated to the nurse practitioner and the pell-mell developments of medical science make it imperative that quality of nursing educational programs must continue to be improved. It is evident that quality of programs hinges in large degree on qualifications of faculty. There can be no question that the number of qualified faculty for our schools of nursing must be increased with all possible haste. Illinois needs more and expanded programs offering baccalaureate and master's degrees in nursing, as recommended above. Three other recommendations relate to the problem.

Recommended

7. That to utilize most effectively the scarce supply of qualified faculty, established baccalaureate programs in nursing should strive for a total enrollment of at least 300 students and technical programs for a total enrollment of 135 or over.

8. That pooling of specialized, scarce faculty be urgently considered by neighboring schools of nursing.

9. That deans of presently organized university schools of nursing work as a group in planning the contribution each school should make to graduate education for nursing by 1980, coordinating this effort with the planning of the State Board of Higher Education.

III. There is an urgent need to increase the opportunities in Illinois for nurse practitioners to update and expand their knowledge in order to keep their skills and competencies current.

Recommended

10. That the University of Illinois College of Nursing be charged with developing a state-wide plan for continuing and extension education for nurses, to be carried out at the university and in cooperation with junior and senior colleges throughout the state.

11. That the Illinois Nurses' Association continue to find ways to strengthen its function of providing opportunities for nurses to update their clinical knowledge and skills and to encourage nurses to seek continuing education to improve their practice.

12. That the Illinois League for Nursing continue to offer educational opportunities for the development or improvement of supervisory, administrative and teaching skills of nurses in Illinois.

13. That Video Nursing, Inc., be requested to consider ways and means of broadening its responsibilities beyond services to nursing schools, possibly through collaboration with a university center, andthat in so doing it include production of other audio-visual techniques and devices for inservice education.

IV. Clinical specialization in nursing is now a necessity; it needs to be actively promoted within the medical profession, hospitals and other health agencies and with institutions of higher learning.

The same forces which led to specialization in medicine are belatedly specializing nursing. The body of knowledge in nursing now has too much breadth and depth to be adequately encompassed in the educational preparation of the

"general duty nurse." Just as in medicine, clinical specialization in nursing requires more education -- a master's degree -- and this reenforces the above recommendations on needs for more university-based nursing programs. The case for more clinical specialization becomes stronger when viewed in the backdrop of the physician shortage, which in Illinois will persist for many years to come. The time of scarce obstetricians and pediatricians, for example, could be used more effectively if nurses who are clinical specialists in these fields were available to work with them. Clinical specialization also has exciting possibilities in hospital services, private nursing practice, psychiatric nursing and community health nursing. In the hospital, clinical specialization offers alternatives to the "careerist" in nursing which in many employment situations do not now exist. In order to advance today, the nurse often must become an administrator. However, if she prefers direct patient care, her natural area of growth should be in clinical specialization. Clinical specialization also holds great promise for improving the rapport and communication between medicine and nursing. The problems here partly relate to the gap which has existed between educational requirements of the two professions. Though clinical specialization in nursing is not new, it is a laggard development as far as Illinois is concerned.

Recommended

14. That through the Illinois Nurses' Association a continuing dialogue be established between medicine and nursing on the most effective use of the nurse clinical specialist in different settings -- in the doctor's office (private practice or group practice clinic), community health programs, hospitals and mental health programs. The healthy growth of clinical specialization in nursing will depend in large part on its degree of acceptance by medical practitioners.

15. That demonstration projects be undertaken in selected Illinois general hospitals and mental health services on how to make the most effective use of the nurse clinical specialist.

V. The appropriate role of the R.N. is not well defined in most employment situations and existing definitions are not well accepted.

Every standing committee of the Commission struggled with these related questions: (1) how to give a higher proportion of the nurse's time to direct care of patients; (2) how to transfer sometimes inherited and sometimes pre-empted "non-nursing" functions to other personnel; (3) how to win acceptance of physicians, institutions and health agencies that these changes are necessary. And it was apparent that within the specialized fields of nursing there is little enough agreement on what a nurse should do or should not do and only limited acceptance of the guidance offered on this subject by the American Nurses' Association. Also apparent was the fact that within these fields the nursing profession does not have anything approaching control of the functions of nurse practitioners. In Illinois, at least, nursing is still a backstop function in the patient care scene. Nurses

not only nurse but also are responsible for many tasks not associated with nursing care when no one else is there to do them. Whether this situation can be changed was one of the most serious questions confronting the Commission. It was evident from the standing committee reports that the appropriate role of the nurse is probably the clearest in the field of private duty and most confused in mental health and community health nursing and in doctors' offices. In mental health, the role of nursing is ambiguous because concepts of psychiatric treatment are in a rapid state of flux. Among psychiatrists there is not even any clear consensus on where nurses should be utilized in the institutional care setting. The argument is that other professionals, with backup by trained attendants, can do the job just as well in selected programs. In general hospitals and extended care facilities, there is at least agreement that R.N.s are needed and that definitions of their role must be refined. But in this field in Illinois there is not yet much evidence of a uniform approach. Confusing this issue for employers and the public is the variety of educational programs that qualify their graduates for the same examination for registration. What is an appropriate role for one R.N. is inappropriate for the next.

Recommended

16. That the development of recommended roles and functions for all specialized fields of nursing, clearly a responsibility of the national professional nursing organization, be given urgent attention. The Commission conveys to the American Nurses' Association its sense of the need for more guidance in this area, as was provided in A.N.A's 1967 Statement on Psychiatric Nursing, with which the Commission concurs.

17. That because there probably always will be diversity in the role of the R.N. based on diversity in patient care needs, every employing institution or agency in Illinois establish a continuing dialogue with its nursing staff on the subject of appropriate roles and functions. Open lines of communication here can benefit all parties concerned, particularly the patient.

18. That in the field of community health nursing (including school and occupational health nursing) a special task force to define roles be appointed. This task force should include nursing leaders, other health professionals, employers, and private citizens and should give particular attention to the comprehensive health services that are now developing.

VI. There is a need for a directed effort in Illinois to improve the utilization of R.N.s and licensed practical nurses.

The need for more effective utilization of nurses is closely related to the problem of clearly defining roles and functions. One problem actually hinges on the other. Delineation of roles provides the tools for measuring what

effective utilization is. But it is the consensus of the Commission that efforts to improve nurse utilization cannot await the "last word" on roles and functions. Enough is known now about what is and what is not good nurse utilization to permit immediate efforts toward improvement. In institutional nursing and public health nursing these needs were recognized as particularly urgent. In hospitals alone, which in Illinois now employ 68 per cent of all active R.N.s, improved utilization offers enormous potential for relieving the nursing shortage.

Table 4. Place of employment of registered nurses working in Illinois, 1966.

| Place of employment | Number of nurses | Percent of total |
|---|---|---|
| Hospital or institution | 22,753 | 68% |
| School of nursing | 2,271 | 4 |
| Private duty | 2,497 | 7 |
| Public health | 1,115 | 3 |
| School nurse | 1,000 | 3 |
| Industry | 1,402 | 4 |
| Physicians' offices | 2,911 | 9 |
| Other or not reported | 664 | 2 |
| Total | 33,613 | 100% |

SOURCE: Licensure renewal questionnaire designed by American Nurses' Association. Data obtained from Illinois Department of Registration and Education for renewals in 1966.

With this in mind, the Standing Committee on Institutional Nursing conducted, with assistance from the U.S. Public Health Service, a study of 31 Illinois hospitals. The sample study included hospitals with extreme variations in staffing patterns. It had a three-fold purpose: (1) to develop a measure or standard against which any hospital may evaluate its current nurse staffing level; (2) to develop a predictive model to permit a hospital to forecast change in staffing levels based on changing operating variables; and (3) to conduct the studies needed to identify significant factors in the different levels of nurse utilization and how they interact. This study is to be reported in detail after its completion in July, 1968.

The Standing Committee on Institutional Nursing also explored efforts in other states to apply industrial engineering approaches to improve management techniques in the nursing unit and in other areas of the hospital. It studied particularly the program of California's Commission on Administrative Services for Hospitals (CASH) for its possible application in Illinois. Also reviewed was the experience of Illinois hospitals with unit manager systems, under which trained managers are placed in charge of the logistics of the nursing station. The primary purpose of this approach is to relieve the head nurse of a high proportion of her record keeping and management tasks.

Recommended

19. That the mathematical model for defining appropriate nurse staffing patterns developed by the Commission Study of Nurse Utilization be presented and applied intensively by Illinois hospitals, with the Illinois Hospital Association, working in concert with the Illinois Nurses' Association, charged with the primary responsibility for directing this program. It is further recommended that this tool be made available to other patient care institutions that employ nurses and its applicability tested there.

20. That the Illinois Hospital Association provide leadership in establishing an independent, ultimately self-supporting Commission to improve management techniques and personnel utilization within the state's health care institutions.

VII. Continuous effort is needed to improve the career incentives and economic appeals of nursing and to open lines of communication between nursing and management on these subjects.

The Commission discussed at great length the economic status of the nurse in Illinois and ways it can be improved. There was agreement that in past years the economic law of supply and demand has not worked to assure the nurse rewards equivalent to her investment in education or her responsibilities in patient care, which have included both nursing care and the coordination of total patient care. The Commission took note of recent substantial improvements in starting rates for R.N.s across the state (a 20 per cent increase between June, 1966, and June, 1967).

Table 5. Monthly starting salary, average salary, and maximum salary for nursing service personnel, Illinois hospitals, June, 1967.

| Personnel classification | Monthly salary[1] | | | | | | |
|---|---|---|---|---|---|---|---|
| | Starting salary | | | Average salary paid | Maximum salary | | |
| | High | Low | Average | | High | Low | Average |
| General duty RN | $650 | $312 | $477 | $503 | $754 | $380 | $531 |
| Head nurse RN | 700 | 380 | 519 | 564 | 912 | 400 | 601 |
| Licensed practical nurse | 447 | 185 | 322 | 352 | 610 | 190 | 386 |
| Nurse aide | 420 | 168 | 257 | 270 | 442 | 198 | 302 |
| Male orderly | 420 | 175 | 287 | 311 | 502 | 230 | 352 |

SOURCE: Illinois Hospital Association Salary Survey, June, 1967.

(1) Excludes shift differential.

In Chicago area hospitals the starting rates for nursing have achieved an approximate parity with other predominately female health professions (dietetics, medical

technology, occupational therapy, physical therapy, medical records) that require college preparation.

Table 6. Monthly starting salary, average salary, and maximum salary for general duty registered nurses compared with other professional and technical personnel, Chicago metropolitan area hospitals, June, 1967.

| Personnel classification | Monthly salary for day shift | | |
|---|---|---|---|
| | Starting salary | Average salary | Maximum salary |
| General duty RN | $534 | $571 | $620 |
| Dietitian, ADA | 549 | 600 | 648 |
| Medical technologist, ASCP | 514 | 563 | 581 |
| Occupational therapist | 518 | 568 | 645 |
| Physical therapist | 532 | 569 | 642 |
| Medical record librarian, RRL | 542 | 577 | 632 |

SOURCE: Illinois Hospital Association Salary Survey, June, 1967

Considerable improvements in salaries have occurred in the fields of nursing education, occupational health and public health nursing. At the time of this report the fields of nursing that lag most in salaries are nursing in doctors' offices and in private practice. The Commission proposes no specific figure for R.N. starting salary rates because rapid changes now in process in the health economy are putting new and different evaluations on nursing and other health services. There was general agreement on the need to establish differentials in starting rates based on the amount of time the nurse gives to education. It was clear that a pattern of technical and professional nursing practice is evolving, and that it is not equitable to establish the same beginning rates for both.

The most controversial area of discussion in the Commission related to the means by which nurses should achieve improved economic status. Organized nursing is committed in Illinois to its "economic security" approach, with collective bargaining, formal recognition of the Illinois Nurses' Association as the bargaining agent, and binding agreements between management and the nurse bargaining unit within the hospital.

Generally, this approach is not presently acceptable to hospitals and other nurse employers. This disagreement was the basis for strikes and other conflicts within Illinois during 1967. Nursing contends that collective bargaining is needed for reasons that transcend economics -- that it is essential as a means of giving the nurse a voice in establishing standards of care and conditions of nursing practice, and in promoting career incentives needed in nursing. This latter point also has not won wide acceptance by institutional management in Illinois, which contends, generally, that standards are the responsibility of nursing service administration.

21. That in Illinois, in the years ahead, nursing salaries and benefits maintain a level that will allow for effective competition with the growing number of other career opportunities for women, that they relate to the nurses educational attainment, and that they adequately recognize years of service and experience.

22. That thereafter, nurses' salaries keep pace with the growth of the economy.

23. That employers give sufficient economic and professional recognition to nurses with higher levels of preparation and responsibility, career incentives essential to promote their permanent attachment to the profession and their commitment to continuing professional growth and improved practice.*

24. That because of the acute problems of recruitment and retention in mental health nursing, a special study be undertaken to identify what economic and other career incentives are needed to relieve this situation.

---

*Six of the Commissioners dissent from the above. They are: Frances L.A. Powell, Mrs. Louise A. Meyer, Josephine A. Brandt, Adeline M. Jorstad, Mrs. Anne Zimmerman and Mrs. Ingeborg Mauksch. Five of these Commissioners personify the presidency of the Illinois Nurses' Association from 1954 to the present, and the Executive Administrator for the same period. They state that:

> "Minutes of the last meeting of the Commission at which economic issues were discussed state: ' This is one area the Commission has not reached agreement on. It was decided that this issue should be discussed again at another meeting of the Commission.' "(Meeting of December 20, 1967, page 4.)

No further discussion took place, so it is understandable that the treatment of this section is incomplete and inconclusive. We therefore affirm that full assessment of the facts developed by the study warrants these conclusions and recommendations:

1. In the years just ahead nursing salaries should be raised at least ten per cent each year to maintain and enlarge the 1966-1967 gain relative to other occupations. Thereafter, nurses' salaries must keep pace with the growth in incomes of the economy and there must be sufficient economic recognition for higher levels of preparation and responsibility to maintain permanent attachment to the profession.

2. The organized activity of nurses to improve their economic status and participate in the determination of their conditions of employment and of nursing practice at their place of work should be welcomed as a constructive force helping to meet nursing care needs of the state.

(continued)

VIII. The move from diploma to associate degree and baccalaureate nursing education programs requires local as well as state planning; the transition must be accomplished in an orderly and gradual fashion without jeopardizing existing sources of supply.

Since 1958, the number of hospital diploma schools of nursing operating in Illinois has declined from 68 to 51, and three of the presently existing programs did not admit a class in the fall of 1967. On the other hand, 11 new associate degree programs have started and six more are planning to open in the fall of 1968, and there are nine baccalaureate nursing programs.

Table 7. Number of initial programs of professional nursing by type of program, Illinois, 1958 - 1967.

| | Number of schools | | | |
|---|---|---|---|---|
| Year | Diploma | Associate degree | Bachelor's degree | Total |

SOURCE: Prior to 1966, Facts About Nursing, American Nurses' Association 1966 and 1967, Illinois League for Nursing

The decline in numbers of diploma programs is being balanced by the growth in associate and baccalaureate degree programs, though the newness of associate degree nursing education in Illinois makes it difficult to project precisely its long-range output of graduates. So a transitional process is well along. The underlying causes of the change seem to be well understood by all parties directly concerned. Certainly the primary one is changing educational aspirations of the kind of young people that nursing must attract. It is clear that a much higher proportion of these young people want a college education. If nursing is not offered in college settings, they will choose another career. Across Illinois,

---

(footnote continued from page 11)

Where non-management nurses seek active participation through their organization, employers should reevaluate traditional opposition to collective bargaining processes.

the recruitment experience of diploma programs is still varied; some good diploma schools are still getting their full quotas of qualified students, but others are having serious problems. This, along with the difficulty of securing qualified faculty and meeting rising educational costs, is now stimulating a reappraisal by the boards of many hospitals operating schools. These civic leaders often become the most active promoters of junior colleges and junior college nursing programs in their communities. Within the Commission there was no real argument as to whether the change should occur or whether it is desirable. The problem is not whether there should be a transition but how to achieve the transition in the most orderly way.

Recommended

25. That adequate nursing education in Illinois be accomplished on the basis of a statewide plan, outlined in detail in the Illinois Blueprint for Nursing Education, 1980 (Chap. III). This plan was not prepared with the thought of being specifically directive on the future course of action of particular schools; rather, it is hoped that it will provide a frame of reference for coordinated effort on the local scene to meet future needs for nursing care. In this sense, then, the plan developed by the Standing Committee on Nursing Education is a "plan for planning." It rests on the following premises:

    a. The preponderance of direct nursing care in the future, particularly in institutions, will be given by technical nurses (graduates of diploma and associate degree programs). There is no expectation by the Commission that there can ever be enough baccalaureate graduates from Illinois programs to meet the need for staff nurses in hospitals and nursing homes, nor is there any feeling that this level of qualification is necessary.

    b. It should not be assumed that new associate or baccalaureate degree nursing programs are, ipso facto, desirable in all areas of the state. A danger recognized by the Standing Committee on Nursing Education was that associate degree nursing be started with too much enthusiasm and not enough planning, and lacking support from adequate clinical facilities in the area.

    c. The two-year curriculum for the associate degree nursing program will establish the mode for all other programs preparing technical nurses. Hospital schools already are shortening their curricula; this process will continue. One by-product of this change will be an increasing number of nurse graduates. Another by-product will be increased

responsibility for employers to provide adequate clinical orientation and inservice education for the nurse graduates they employ.

d. All hospital diploma programs should seek N.L.N. accreditation at the earliest possible date; accredited diploma programs should continue. When other programs can be developed locally that give clear promise of meeting future needs and, hopefully, expanding the output of nurse graduates, the future of hospital schools in that area should be reconsidered.

e. The transition from diploma to associate and baccalaureate degree education does not imply abandonment of hospital educational responsibility; it means only a change in the responsibility. The likelihood is that more Illinois hospitals than at present will be involved in nursing education at the clinical level after the associate degree, baccalaureate and master's programs are fully developed.

f. Programs for preparing licensed practical nurses should be continued and, if possible, expanded to produce a 100 per cent increase in graduates by 1980. There are misgivings, though, in both the Standing Committee on Nursing Education and the Commission, about LPN programs financed through the Manpower Development and Training Act because of its instability as a source of permanent financing. It recommends that these programs be brought under the aegis of the State Board of Vocational Education and Rehabilitation, with support from local school funds.

g. Pre-service preparation of assistants to nurses (now generally called nurse aides) should be offered through vocational education in secondary schools and junior colleges, though orientation and on-the-job training of these personnel should continue to be given by the employing agency.

h. Effective planning for nursing education cannot be directed by a statewide organization; to be effective, it must be locally based and involve all the concerned groups -- nursing along with community leadership, local educators, hospitals and other clinical resources. However, ...

i. The role of the continuing arm of the study commission, as recommended later, should be one of rendering guidance and technical assistance to local planning efforts, and of coordinating planning for nursing education.

IX. Relationships between nurses and physicians in the patient care setting are frequently strained and a cause for both job dissatisfaction and concern among nurses.

Improved relationships and communication will benefit all parties involved, especially the patient. The traditional alliance of medicine and nursing seems to be disturbed by sociological forces and by the profound changes taking place in the organization and delivery of health services. This problem was just below the surface in much of the Commission deliberations. It is apparent that there is no uniform pattern in nurse-physician relationships, and no structure for improving them, across Illinois. Particularly within hospitals they vary according to the particular climate and personalities involved. It was apparent to the Commission that no statewide, organizational solution showed much promise of influencing change in this area. Instead, it was felt that improvement will depend upon local initiative and innovation. There was no disagreement within the Commission on the point that better communications are needed. Patient welfare is quite clearly involved and a recent Illinois court decision has in effect brought together the legal responsibility of the hospital and its nursing staff and that of the physician.

Recommended

26. That all patient care institutions in Illinois be urged to structure frequent and regular communication between their medical and nursing staffs through such devices as "Committees on the Improvement of Patient Care" and patient care planning committees in a given service or nursing unit.

27. That the medical staffs of hospitals be urged to formally include nurse leadership of the hospitals in all of their staff committee activities that involve nursing in any way.

28. That the growing importance of the nurse in planning and implementing the care and rehabilitation of chronically ill and handicapped patients be given particular recognition and that all patient care institutions be urged to develop guidelines for such care which will receive the support of physicians and nurses.

X. There is too little involvement of nursing in health planning, both locally and at the state level; such involvement is much needed and will benefit the planning process.

Comprehensive health planning (Public Law 89-749) and the Regional Medical Program (Public Law 89-239) are presently being implemented in Illinois. Nearly all standing committees of the Commission expressed a sense of urgency about the need for nursing leadership involvement in these activities. It is apparent that in health facilities and other health planning activities in

Illinois to date, nursing has often not been included nor has it always shown interest. The need for involvement was expressed with the greatest urgency by the Standing Committees on Mental Health and Community Health Nursing. In mental health planning as directed by the Department of Mental Health there has been almost no meaningful nursing involvement to date. In public health nursing the very future of this specialty seems to hinge on whether the nurse's role is defined and understood and whether her full potential is realized in the comprehensive community health services that are now developing. Health services and facilities planning in Illinois without nursing involvement often has lacked realism; services and facilities are created without any real hope of their being staffed -- by nurses or other essential health professionals.

Recommended

29. That there be active involvement of nursing leadership in comprehensive health planning, both at the state level and locally.

30. That the State Department of Public Health, in its future administration of Public Law 89-749, make its approval of the development of new facilities and community health services contingent upon a demonstration by the sponsors of a reasonable capacity to staff them; also, that it actively promote the consolidation of specialized institutional and community health services by area or community as a means of promoting more effective use of the present limited supply of R.N.s.

31. That nurses be appointed to the Illinois Hospital Licensing Board as well as to other health service licensing boards which exist at both the state and local levels.

XI. The present movement towards comprehensive community health services has large and exciting implications for nursing in Illinois; at present, though, nursing is not geared to make a maximum contribution in this movement, nor does it have much influence on the movement itself.

The field of public health, and its nursing component, has not been growing or thriving in Illinois. Illinois has been and still is far below the national average in what its taxpayers have been willing to invest in local health services. For example, it ranks 28th among the 50 states in per capita state assistance to localities for health services and 35th in the amount expended per dollar of personal income of its residents for health and hospitals by the state and local government. In these services, nursing has not had a well defined role. The State Department of Public Health has not been structured to give overall professional direction and leadership to these nursing services. Local health services are poorly coordinated. Frequent duplication and overlapping of services occurs between local health departments and visiting nurse associations, Illinois State Services for Crippled Children, voluntary mental health clinics, tuberculosis control agencies, industrial health, and school health services. One component

of community health, school nursing, has increased more markedly than other community nursing services. The number of school nurses employed by Boards of Education in Illinois increased 650 per cent between 1943 and 1967, according to the census of public health nurses, Illinois Department of Public Health.

In its totality, community health nursing in Illinois is a patchwork, not only lacking in broad direction but structured in so many small units with overlapping purposes that the nurse is often not efficiently utilized. Medicare with its coverage of outpatient and out-of-hospital services, the new Office of Economic Opportunity Neighborhood Health Centers, the new comprehensive health planning responsibilities vested in the State Department of Public Health -- all are creating a new surge of activity in community health. Where and how nursing fits in this is still not clearly defined.

Recommendations on the role of the nurse in community health, requiring her meaningful involvement in comprehensive health planning, have already been cited.

Recommended

32. That the Illinois Department of Public Health be urged to create a Division of Nursing, the director of which should be qualified and authorized to direct all nursing services of a department charged with providing leadership and consultation to community nursing services across the state.

33. That a demonstration project be undertaken in the development of centrally managed pools of nursing resources that, under contract, could provide a variety of community nursing services to health departments, school districts, home-health services, mental health clinics, tuberculosis control programs, occupational health services and the like.

34. That the Department of Public Health give leadership in the development of more adequate clinical practice situations for nursing students in community health services.

35. That the University of Illinois College of Nursing be encouraged to implement at an early date its plan for a master's program in public health nursing.

36. That the Department of Public Health be encouraged to provide the needed financing for continuing education programs for community health nurses.

37. That the Illinois Department of Labor responsibilities for occupational health be transferred back to the Illinois Department of Public Health

and incorporated in the Bureau of Occupational Health, as recommended in the Hilleboe-Shaefer Report on Health Services to the Commission on State Government, Illinois, 1966.

XII. All nurse recruitment efforts in Illinois need reappraisal; there is a need for a more intensive effort in recruitment within the profession focused on leadership development and the specialized fields of nursing; there also is a need for more coordination and sophistication in recruitment efforts at the entry point in nursing.

Nursing has lost ground in the proportion of Illinois female high school graduates it attracts; ten years ago this was 9 per cent; today it is 6 per cent.

Table 8. Percent of female high school graduates admitted to professional nursing schools in Illinois, 1951 - 1966.

| Year of high school graduation | Female high school graduations | Admission to professional schools of nursing | Percent of high school graduations |
|---|---|---|---|
| 1951 | 28,000 | 2,850 | 10.2 |
| 1952 | 29,500 | 2,809 | 9.5 |
| 1953 | 29,500 | 2,931 | 9.9 |

| 1964 | 49,000 | 3,066 | 6.2 |
| 1965 | 59,000 | 3,213 | 5.6 |
| 1966 | 54,500 | 3,342 | 6.1 |

SOURCE: High school graduations from Office of the Superintendent of Public Instruction, State of Illinois. Nursing school admissions prior to 1964 from Facts About Nursing, American Nurses Association. 1964 - 1966 from Illinois Department of Registration and Education.

Currently, baccalaureate and associate degree nursing programs in Illinois do not particularly need the backup of a stronger recruitment effort. Many baccalaureate programs especially have more applicants than they can accept and, as stated earlier, the present need is for more and larger programs. The associate degree nursing programs, all but one quite new, are confirming forecasts that they can successfully tap additional sources of supply for nursing. As more of them become operational, it is likely that more of them will need the assistance of broad, statewide recruitment efforts. The recruitment experience of the diploma school is presently mixed. The problems seem most acute with smaller, non-accredited schools and with schools that have always held to a high standard and, in effect, are competing with the colleges and universities for students. Relatively, it is clear that the number of applications to diploma schools is declining in proportion to applications to associate degree and baccalaureate programs.

Table 9. Applications to programs of professional nursing, Illinois, 1964 - 1966

| Type of program | Number of applications in 1964 | Percent increase 1964 - 1965 | Percent increase 1965 - 1966 |
|---|---|---|---|
| Diploma | 5,998 | 9.9 | -4.5 |
| Associate degree | 336 | 64.6 | 25.1 |
| Baccalaureate | 747 | 15.2 | 38.1 |
| Total | 7,081 | 12.6 | 2.0 |

SOURCE: Illinois Study Commission survey of Illinois schools of professional nursing

There is an urgent need to recruit more nurses into master's degree programs, whether they be in Illinois or out of state with Illinois nurses returning home after completion of the programs. Generally, Illinois master's programs in nursing could accommodate more students if they could get them, but they, of course, are handicapped by the very limited pool of baccalaureate graduates in Illinois to draw from. This situation has improved somewhat in recent years as the following table on nursing school admissions by type of program shows. Illinois is still behind most states in this respect however.

Table 10. Number and percent distribution of admissions to initial programs of professional nursing by type of program, Illinois, 1954 - 1966.

| Year | Diploma schools | | Associate degree schools | | Baccalaureate schools | | Total | |
|---|---|---|---|---|---|---|---|---|
| | Number | Per cent | Number | Per cent | Number | Per cent | Number | Per cent |

SOURCE: Prior to 1964 from Facts About Nursing, American Nurses Association
1964 - 1966 from Illinois Department of Registration and Education

Many standing committees of the Commission expressed the need for recruiting more men into nursing. It was generally agreed that improvements in the economic appeals of nursing, present and future, will do more than any other specific recruitment appeal to bring men into the profession.

Primary responsibility for nurse recruitment in the state has been carried by the Illinois League for Nursing and its local constituents and by the Chicago Council on Community Nursing, recruiting in the metropolitan area only. A relatively new entry is the Health Careers Council of Illinois, which includes nursing in a multi-health professions appeal to high school counselors and students. This organization, which has nursing representation on its board, probably now has more frequent access to the prospective nursing student than any organization now active in recruitment, but it is inherently limited in the amount of time it can give to nursing. Many other organizations have recruitment programs -hospital and medical auxiliaries, departments of state government, service leagues and the like. Their efforts are not well coordinated.

Hospitals in Illinois which have provided refresher courses for inactive nurses have encouraged many of them to return to practice. The Chicago Council on Community Nursing coordinates a Refresher Course Program in the

Chicago Metropolitan Area; in the period 1957 to 1967, twenty hospital centers "refreshed" 1,050 registered nurses in 107 classes conducted by them in cooperation with C.C.C.N's on-going program. A 1967 Illinois Hospital Association survey of hospitals in other parts of the state revealed that 35 hospitals have given 65 refresher courses with a total of 920 nurses completing them. At least one community college has also provided a refresher course for inactive nurses.

In August, 1967, the Illinois Nurses' Association launched the Inactive Health Personnel Project in Illinois, funded by a grant from the Public Health Service, Division of Health Manpower. Development of a state-wide coordinated nurse-reactivation program plan is progressing well.

Recommended

38. That a Joint Committee on Nursing Careers be formed by the Illinois League for Nursing, the Illinois Nurses' Association and the Chicago Council on Community Nursing to intensify and enhance a state-wide nurse recruitment program, and that this program be coordinated with that of the Health Careers Council of Illinois and the Illinois State Medical Society Committee on Health Careers; further, that this Joint Committee give particular attention to recruitment within the profession for nurses to prepare for positions that require higher educational attainment.

39. That new recruitment materials be developed, stressing a broad range of nursing career opportunities. Special emphasis and attention to unique problems is needed for recruitment into mental health and community health nursing because of urgent needs for more personnel in these fields.

40. That the Joint Committee on Nursing Careers design ways and means of involving more nurses in recruitment efforts at the local level.

41. That the Illinois Nurses' Association give continuing leadership to statewide planning for nurse reactivation programs, broadening the program to include all fields of nursing in which significant numbers of nurses are interested, and coordinating it with present ongoing efforts of the Chicago Council on Community Nursing, hospitals and other agencies.

42. That the Superintendent of Public Instruction, State of Illinois, be supplied with current information about nursing education and career opportunities and be encouraged to intensify his efforts to promote nursing through guidance counselors in the public school system.

XIII. More financial assistance is required to attract and support nursing students at every level.

A variety of financial aids are available to nursing students in Illinois. There are the scholarship programs of the Chicago Council on Community Nursing, Illinois League for Nursing, Illinois Departments of Mental and Public Health, and Illinois Scholarship Commission. In addition there is an uncounted number of scholarships with voluntary sponsorship -- from hospital and medical auxiliaries, Kiwanis and Rotary, agricultural groups and the like. More recently, assistance has come from the federal government in the form of loans from the Federal Nurse Training Act of 1964. In the 1965-66 school year, $1.5 million in loans came to Illinois nursing students under this program. In spite of this apparent abundance, it is clear that some students or prospective students are still having difficulty matching needs to available funds. Some reasons: (1) the great divergence in the amount of the scholarships; (2) differences in policy on what costs are covered -- tuition, other fees, maintenance, in full or in part; (3) more divergence in policy on what the student must (or should) give in return -- a year of service for a year of support, loan repayment (and forgiveness) provisions, or simple (or not so simple) moral obligations. In this situation, it is not surprising that all scholarships, loans and grants-in-aid are not used each year. Some of them are too small to be meaningful to the student in any case. Cumulatively they could be meaningful, if sponsors were persuaded to pool them for students who have been identified as needing assistance.

The standing committees of the Commission have identified these areas of particular need: (1) assistance to the R.N. graduate of a diploma or associate degree program who wants to obtain her baccalaureate in nursing. Federal and state assistance to this student is limited to only the senior year, whereas two to three years of study are necessary; (2) assistance to the student who wishes to enter a baccalaureate program in a private or state university or a diploma program with a relatively high tuition and needs full support; (3) assistance for the graduate student in nursing. Though federal traineeships are available to this student, the Commission believes that additional financial incentives are needed in Illinois to attract the numbers needed.

Recommended

43. That the Illinois Joint Committee on Nursing Careers establish a clearing house on available financial aids for nursing students and encourage the donors of this aid to pool resources so that truly meaningful assistance can be given to individual students.

44. That financial aids be assigned with attention to priorities of need stated by this Commission.

45. That the U.S. Public Health Service and Congress be encouraged to provide traineeships for the last two years of a baccalaureate program for R.N.s instead of the present one year.

46. That the Illinois Department of Mental Health, the Illinois Department of Public Health and the Illinois Scholarship Commission continue and expand their financial assistance to all nursing students. Also, that the employment agreements between students and the Illinois Department of Mental Health be broadened to apply to any mental health service in the state rather than only to facilities operated by the Department.

47. That the Illinois Joint Committee on Nursing Careers explore and assess the potential of new avenues of financial assistance to bring more of the economically deprived into nursing.

XIV. The shortage of nurses in Illinois is a fact. Conservative projections of future needs imply a substantial expansion of nursing education capacity, as well as urgent attention to improvements in nurse utilization, retention of nursing personnel and recruitment of inactive nurses into practice.

There were 33,613 nurses working in Illinois in 1966, for a ratio of 310 active nurses per 100,000 population. An additional 20,287 were inactive or did not report activity status.

Table 11. Active and inactive nurses per 100,000 population, Illinois, 1951 - 1966

| Year | Population of Illinois | Active nurses | | Inactive and unkown status nurses | | All nurses | |
|---|---|---|---|---|---|---|---|
| | | Number | Per 100,000 population | Number | Per 100,000 population | Number | Per 100,000 population |
| 1951 | 8.7 million | 21,240 | 244 | 15,019 | 173 | 36,259 | 417 |
| 1957 | 9.7 million | 24,024 | 248 | 15,871 | 164 | 39,895 | 411 |
| 1962 | 10.0 million | 28,890 | 286 | 19,751 | 195 | 48,641 | 482 |
| 1966 | 10.8 million | 33,613 | 310 | 20,287 | 188 | 53,900 | 499 |

SOURCE: 1951, 1957, 1962 - Health Manpower Source Book 2, Nursing Personnel, U.S. Department of Health, Education, and Welfare, Public Health Service Publication No. 263, revised 1966.

1966 - Data obtained from licensure renewal questionnaire designed by American Nurses' Association. Data obtained from Illinois Department of Registration and Education for renewals in 1966 and applied to estimated Illinois population for 1966.

A 1966 survey of hospitals, the major employer of nurses in the state, showed that they employed 23,569 registered nurses. These same hospitals reported 4,462 unfilled positions for R.N.s.

Table 12. Budgeted vacancies for registered nurses, licensed practical nurses, and nurse aides and orderlies, all Illinois hospitals, 1966

| Personnel category | Number of personnel reported (1) | Number of budgeted vacancies (1) | Percent vacancy |
|---|---|---|---|
| Registered nurses | 23,569 | 4,462 | 16% |
| Licensed practical nurses | 6,393 | 2,548 | 28% |
| Aides and orderlies | 32,808 | 6,349 | 16% |

SOURCE: Manpower Resources in Hospital, 1966. Summary Report of a Survey Conducted by the Bureau of Health Manpower, Public Health Service, and the American Hospital Association.

(1) Projection if all hospitals had returned questionnaire, based on 78 percent returns.

In the Department of Mental Health institutions alone there were 980 vacancies reported in late 1967, with a vacancy rate of 38 per cent for administrative positions, 78 per cent in community mental health nursing, 48 per cent for instructors and 44 per cent for staff nurses. All other major employment areas for nursing reported serious nurse manpower needs. An important factor in the "shortage" is the large number of nurses who are working part-time. In all hospitals, approximately half of the nurses employed are part-time.

While the Commission recognizes that vacancy rates may not accurately express needs, it is impressed by the fact that there is an effective demand at present in Illinois for 6,000 to 8,000 more registered nurses. It is also aware that this demand is being sharpened by improvements in financing of long-term care facilities; better payment for care of the aged and long-term ill, and the higher government standards that go with it, are making the nursing homes and extended care facilities a stronger competitor in the nurse employment market. The Commission found no indication in the burgeoning health economy that the demand for nurses will slacken, but recognizes that demand can be moderated by more effective patterns of utilization.

Quantitative and qualitative needs and projections reported by each of the standing committees of the Commission are reported in the tables which follow:

Table 13. Summary of active registered nurses needed in Illinois in 1980 by field and educational level

| Field | Number of R.N.'s needed with | | | | |
|---|---|---|---|---|---|
| | Doctorate | Master's degree | B.S.N. | Diploma or A.D. | All R.N.'s |
| General hospitals | --- | 650 | 6,900 | 25,243 | 32,793 |
| Long term care facilities | --- | 135 | 400 | 4,625 | 5,160 |
| Psychiatric hospitals & community services | --- | 400 | 1,600 | 3,000 | 5,000 |

SOURCE: Recommendations of each individual committee of the Illinois Study Commission on Nursing.

(1) Based on a 20 percent rise in population with no change in need.

(2) Based on a decreased number of private duty nurses, as is the present trend.

(3) Based on the following faculty/student ratios: Doctoral 1/6, Master's 1/6, B.S.N. 1/12, A.D. 1/15, L.P.N. 1/20. Based on the following recommended graduations in 1980: Doctoral 25, Master's 300, B.S.N. 1,200, Diploma and A.D. 2,400. L.P.N. graduations assumed to double by 1980 for a total of 3,000. This makes total enrollment: Doctoral 75, Master's 600, B.S.N. 4,800, Diploma and A.D. 4,800, L.P.N. 3,000. Assumes no attrition in any program.

Table 14. Summary of number of registered nurses needed to be produced in Illinois in 1980 by educational level

| Number required | Doctorate | Master's degree | B.S.N. | Diploma or A.D. | Total |
|---|---|---|---|---|---|
| 1966 - number we have | 46 | 710 | 3,244 | 29,613 | 33,613 |
| 1980 - number we need | 279 | 2,793 | 11,825 | 42,698 | 57,595 |
| Total we have to get | 233 | 2,083 | 8,581 | 13,085 | 23,982 |
| Average number of graduations required per year | 17 | 149 | 613 | 935 | 1,714 |
| Number of graduations required per year with attrition figured as follows: | | | | | |
| Doctorate - 2% | | | | | |
| M.S. - 2% | | | | | |
| B.S.N. - 3% | | | | | |
| A.D. - 4% | 18 | 163 | 710 | 2,120 | 3,011 |
| 1966 - actual graduations | 0 | 25 | 256 | 2,082 | 2,363 |
| 1973 - midpoint graduations | 18 | 163 | 710 | 2,120 | 3,011 |
| 1980 - required graduations | 36 | 301 | 1,164 | 2,158 | 3,659 |
| 1980 - required graduations with allowance for advanced education figured as follows: | | | | | |
| A.D. - 10 percent to enter B.S.N. program | | | | | |
| B.S.N. - 301 to enter master's program | | | | | |
| M.S. - 36 to enter doctoral program | 36 (1) | 337 (1) | 1,465 | 2,374 | 4,212 |

SOURCE: Compiled from Table 1 and Table 13.

(1) Twenty five of the R.N.'s graduating with doctorates in 1980 will earn the doctorate in nursing; 11 will earn a doctorate in a related field. Of the R.N.'s obtaining master's degrees in 1980, 300 will obtain them in nursing and 37 in a related field. Although it is recognized that there is an exceptionally large attrition in master's and doctoral programs, only the number of students required for graduation are shown as entering the programs. This is because nurses failing to complete the programs are expected to return to practice at the highest level for which they were trained.

Recommended

48. That a 1980 goal of 58,000 employed registered nurses be accepted for Illinois, increasing the present ratio to 440 nurses per 100,000 population, assuming a population of slightly over 13 million as currently projected.

49. That the number of master's degree graduates in nursing (25 in 1966) be rapidly increased to an annual total of 163 in 1973 and 301 in 1980.

50. That the number of baccalaureate nursing graduates (256 in 1966) be increased to an annual total of 710 in 1973 and 1,465 in 1980.

51. That the number of associate degree and diploma graduates (2,008 in 1966) be increased to an annual total of 2,120 in 1973 and 2,374 in 1980.

XV. Urgency to initiate the kind of action that will provide personnel to meet Illinois' nursing needs in 1980 dictates that an ongoing mechanism be created to assure implementation of the recommendations of the Illinois Study Commission on Nursing, and to take responsibility for revising and updating these recommendations as circumstances indicate.

Recommended

52. That an ongoing plan be established by the Illinois Nurses' Association and the Illinois League for Nursing to implement the Commission's conclusions and recommendations;

* That the mechanism established include representation from medicine, hospitals, other related health fields, the education system and the public;

* That adequate financing be secured on an annual basis to assure the effectiveness of such a mechanism; and

* That the mechanism's essential functions include implementation, information gathering, updating of information, evaluation, reporting, consultation and coordination.

53. That the Illinois Department of Public Health, through its comprehensive health planning mechanism, be charged with responsibility for providing data on nursing needs and resources, making it available to the ongoing mechanism of the Commission, to the Illinois Board of Higher Education and to other appropriate state agencies or organizations involved in planning for nursing manpower.

54. That the Illinois Department of Registration and Education assist the Department of Public Health in providing data on nurse manpower by taking an annual inventory of registered and practical nurses at the time they renew their licenses and making the inventory cards available to the Illinois Department of Public Health.

## CHAPTER II

## NURSING IN ILLINOIS

Shortages of nurses persist in Illinois although the number of nurses licensed and employed in the state has increased greatly and at a faster rate than the growth in population. The shortages result from demands for nursing, especially in hospitals and community health services, that have surpassed even the substantial growth in numbers of nurses working.

### Present Supply

Registered nurses working in Illinois have increased from 248 per 100,000 population in 1957 to 310 per 100,000 population in 1966. Almost 54,000 Illinois residents in 1966 were licensed as registered nurses; 33,613 (62 per cent) of them were actively employed as registered nurses. Only 440, slightly more than 1 per cent, of all registered nurses working in Illinois in 1966 were men. Best estimates indicate 68 per cent of employed nurses work full-time; the remaining 32 per cent average two days' work per week, Contrary to popular opinion, nurses work after they marry. In every age group from 20 to 60 years, married women constitute the majority of nurses working; 63 per cent of all nurses working in 1966 were married; 10 per cent were divorced or widowed; 27 per cent were single. (See Table 15, next page)

Illinois' supply of nurses in comparison with other states is close to the average, though the state ranks considerably higher in some factors usually contributing to demands for nursing and other health services. Illinois' rank among the United States in some factors relevant to nurse supply and shortage is revealing.

Table 16. Illinois rank among the states on selected factors related to health, 1964.

| Factor | Rank |
|---|---|
| Effective buying income per capita | 9 |
| Death rate | 10 |
| Hospital beds per 1,000 people | 15 |
| M.D.s per 100,000 people | 18 |
| Employed registered nurses per 100,000 people | 25 |
| Birth rate | 28 |
| Employed practical nurses per 100,000 people | 44 |

Table 15. Employment status of all registered nurses living in Illinois, by age and marital status, 1966.

| Age and work status | Marital Status | | | | | |
|---|---|---|---|---|---|---|
| | Single | Married | Divorced | Widowed | No answer | Total |
| 20 - 29 | | | | | | |
| Employed in nursing | 3,745 ( 96%) | 5,106 ( 65%) | 107 ( 91%) | 11 ( 79%) | 13 ( 68%) | 8,982 ( 75%) |

SOURCE: Licensure renewal questionnaire designed by American Nurses' Association. Data obtained from Illinois Department of Registration and Education for renewals in 1966.

## Inactive Nurses

Indeed, the main source of increase in nurses has been married women continuing in practice or returning to practice after a period of time devoted to child-rearing. A special study of nurses reporting themselves professionally inactive in 1966 was undertaken in the spring of 1967, almost a year later. Almost 9,000 inactive nurses (47 per cent of those reporting themselves inactive or failing to report activity in 1966) returned questionnaires. (See Table 17.) Sixteen per cent of these (1,428) had already returned to full or part-time work in nursing, and an encouraging number indicated that suitable working times, adequate financial incentives, and availability of appropriate care for their children could more than double the number of returnees in 1968 (See Table 18).

## Practical Nurses

Faced with increasing demands over the past 25 years, registered nurses and the health services in Illinois and other states have adopted a series of efforts designed to alleviate shortages. The first was a decision to stratify nursing, delegating less complex nursing tasks and the care of patients whose condition was stable to assistants who would work under the supervision of registered nurses. Schools for practical nurses were established, usually in vocational schools in local school districts,and a corps of trained practical nurses was developed to assist in patient care. In Illinois, the first state-approved practical nursing program was started in the Chicago Public School system in 1949. The legislature passed state laws licensing practical nurses and governing their practice. Increasing numbers of them were employed by hospitals, nursing homes, community health services. However, 43 states have a higher licensed practical nurse-to-population ratio than Illinois. Some authorities contend that the Illinois pace in expanding practical nursing programs is related to the fact that the state has a fairly high ratio of R.N.s to population. They also cite the opinion of state education and nursing officials and leaders who were concerned about passing the saturation point for such schools. In 1954 there were 5 state-approved schools of practical nursing; in 1967 there were 34.

Legislation was passed in 1965 making state licensure mandatory for practical nurses. In 1966,12,280 practical nurses were licensed in Illinois, and most of them work in hospitals.

## Diversion of Nurses' Time from Patient Care

Despite the substantial growth in numbers of practical nurses employed, the shortage of nursing personnel persisted and led to the employment, especially in hospitals, of large numbers of aides and attendants. Because these workers have no training before employment, they must be taught on the job and constantly supervised in their work by registered nurses. While this increased the numbers of nursing personnel, it decreased markedly the time registered nurses have available to spend with patients. This diversion of R.N. time from patient care to the supervision of assistants, though necessary for assuring patient safety,

Table 17. Work status of Illinois registered nurses in 1967 who registered as inactive in the 1966 inventory

| Status in 1967 | Number of R.N.'s | Percent of total |
|---|---|---|
| Working full time in nursing | 340 } 1,428 | 3.9% } 16.3 |
| Working part time in nursing | 1,088 | 12.4 |
| Job hunting for position in nursing | 174 | 2.0 |
| Working full time in other field | 50 | .6 |
| Working part time in other field | 70 | .8 |
| Still inactive | 4,690 | 53.2 |
| Did not answer question | 2,395 | 27.1 |
| Total returning questionnaire | 8,807 | 100.0 |

SOURCE: Survey of inactive nurses conducted by Illinois Study Commission on Nursing

Table 18. Illinois inactive nurses who would go back to work within the year if certain conditions were met

| Condition | Number of R.N.'s (1) |
|---|---|
| Suitable working hours | 883 |
| Suitable days of the week | 686 |
| Financially profitable | 512 |
| Appropriate care available for children | 501 |
| Refresher course to up-date knowledge | 456 |
| Supervised nursing practice to up-date knowledge | 377 |
| Employment available nearby | 251 |

SOURCE: Survey of inactive nurses conducted by Illinois Study Commission.

(1) Some R.N.'s checked more than one condition; therefore, these numbers cannot be summed to arrive at a number of Illinois R.N.'s considering going back to work within the year.

is regrettable and the source of much dissatisfaction among registered nurses. Another change derives from the increased number and complexity of medications and other treatments that must not only be administered to patients but must be scheduled, accounted for on patients' records, and reported to medical records and fiscal departments. These developments have necessarily increased with the capability of medical science, the complexity of patient care services, and the specialization of medicine; they will continue to do so.

The second type of effort to alleviate nursing shortage was aimed at removing from nursing's responsibility some of the tasks not directly associated with patient care and safety. Even before the recent salary increases for nurses, attempts had begun in some hospitals and community health agencies to identify the paper work and other control and coordinating tasks not requiring nursing knowledge and skill, such as inventory and supply, and routine communication of internal hospital administrative operations. Both nurses and administrators of hospitals and community agencies have been slow to identify and to "centrifuge" out of nurses' responsibilities these essentially non-nursing activities.

The time, skill, and knowledge of nurses should be released for and concentrated upon direct care of patients. A serendipitous effect of increasing nurses' salaries may be to make their services so much more expensive than clerks or secretaries that the latter will then be employed in much larger numbers on wards of hospitals, units of clinics and health services, and district offices of community health services. The time and talent of registered nurses can then be redirected where it is most needed and most appropriately devoted -- to planning and providing nursing care of patients. Some internal reorganization of administrative channels of responsibility is required,[1] and some Illinois hospitals have already begun the necessary rearrangement.

## Movement Toward Technical and Professional Nursing Practice

Efforts to alleviate nurse (and physician) shortage continue and the most recent is a further refinement of the stratification of nursing. Previous stratification created two groups of nurses' assistants. Present movements are directed toward stratification of the registered nurse group into a corps of professionals educated collaterally with other health service professionals in colleges and universities and a corps of talented, skilled technical nurses educated collaterally with other health service technicians in community colleges. The latter will continue, as registered nurses always have, to serve in the direct care of patients in hospitals, extended care facilities, clinics, and home health services. Professional nurses of the future will become clinical specialists and consultants in their specialty as well as teachers, supervisors and administrators of nursing services. They will work in hospitals and outside of them in much closer association with medical care and practice.[2]

The changes in nursing described here are already evident in Illinois, but Illinois will encounter more than average difficulties in coping with them because the state has been slower than many others to create and enlarge baccalaureate

and master's degree programs, which will be the principal source of nurse leadership. The importance of a bachelor's degree in nursing is that it provides education not only in the biological and social sciences supporting nursing but in cognitive, innovative skills for designing and implementing nursing approaches to patients, techniques, and procedures. The master's degree in nursing adequately prepares nurses for clinical specialization in nursing practice, for teaching, for direction of patient care services, and for systematic investigation of problems encountered in nursing practice. From such training must come future nursing leaders, change agents, innovators. In 1966, 88 per cent of the 34,000 nurses living and working in Illinois had little or no education beyond hospital training; only 10 per cent had completed the bachelor's degree. Two per cent had completed master's degrees, and almost all of these were teaching or directing patient care services.

## Nurses in Hospitals

Hospital services have claimed an increasing share of the nurse-manpower available. Hospital beds in Illinois increased more than 20 per cent between 1954 and 1964, keeping up with population growth. But that population used hospitals more; 15 per cent of all Illinoisans spent some time as in-patients in general hospitals in 1964 while only 10 per cent did so in 1945. The daily average number of patients hospitalized increased 54 per cent between 1954 and 1964. The full effects of Medicare and Medicaid cannot yet be gauged, but increased hospital demand is already evident and will grow further. In addition to growth of in-patient care required, hospitals are experiencing widespread use of their emergency services by patients with non-traumatic illness -- patients who cannot reach their own physicians or who have not sought out a "family doctor."

The Commission's review of Illinois nursing coincided with a national assessment of hospital personnel by the American Hospital Association and the U.S. Public Health Service.[3] Twenty-three thousand registered nurses (68 per cent of Illinois' registered nurse complement) worked in hospitals in 1966. Their services were augmented by more than 6,000 licensed practical nurses and 34,000 aides and attendants. Yet in this survey Illinois hospitals reported budgeted positions vacant in every category: 16 per cent for registered nurses, 28 per cent for licensed practical nurses, and 16 per cent for technical aides and attendants.

The future role of hospitals in health services is not yet clear. Will they become the center of community health services or one special service in a chain of comprehensive and continuing health services? Whatever their role in the future, we must anticipate not only that they will need more people but better trained staff at every level. In hospitals especially, attention is being directed to increasing productivity of every kind of personnel.[4]

## Mental Health Services and Nursing

Prompted by dramatic advances in psychiatry and patient management, Illinois' new mental health plan recently inaugurated approaches designed to find patients earlier and to care for them in "zone centers" where clinic and short-term care would permit the continuance of as nearly normal daily living patterns as possible. Many of the means used in public health to find and control infectious disease are being tested and applied in mental illness, and the results are very promising. The usual "state hospital" will continue, but services there, too, are being reorganized to capitalize on new developments in the field. But much remains to be done.

Most of our mentally ill are cared for in state hospitals. The traditional state hospital has been more custodial than therapeutic, a reflection of its inability to obtain sufficient professional staff. Though the numbers of patients hospitalized for mental illness and retardation far exceed those hospitalized for other reasons on any day (55,000 vs. 35,000 in Illinois last year), only 4 per cent of Illinois' registered nurses and 1 to 2 per cent of our practical nurses are employed to care for the mentally ill. More than one out of every four registered nurses caring for the mentally ill (28 per cent) are employed in psychiatric units in general hospitals, which now provide more than 1,000 beds. Psychiatric aides provide most of the care in state hospitals, where they outnumber registered staff nurses almost ten to one.

A survey undertaken as part of the Commission's work revealed that approximately 50 per cent of the state's budgeted positions for registered nurses and 30 per cent of those for licensed practical nurses are vacant; the vacancy rate for aides is 24 per cent.

Most registered nurses have had some instruction and practice in psychiatric nursing as part of their education since these have been required for admission to the registered nurse licensing examination in Illinois for many years. But generally this exposure to psychiatric nursing has been through courses taught in the state mental hospitals where most registered nurses, because of their small number and the nature of custodial service, are concerned with management rather than with direct care of psychiatric patients. The result has been both inadequate education for therapeutic psychiatric nursing and rejection of psychiatric nursing as a field attractive for a career in nursing. Illinois has only recently offered a master's degree program in psychiatric nursing.

Progress in the Illinois mental health program will continue to change the nature and effectiveness of services for the mentally ill. Thus far, most changes have affected health professionals other than nurses. The Mental Health Nursing Committee of the Commission addressed itself specifically to nursing in Illinois' mental health services, governmental and voluntary, and its recommendations, if implemented, will result in the increased quantity and

capability of psychiatric nurses necessary.

## Community Health Nursing, Including Schools and Industry

Continuity and comprehensiveness of health services of all kinds require community health services available to the public in neighborhood clinics, in homes, at work, in schools. Illinois' community health services are organized and delivered through a variety of separate agencies: state and local health departments, University of Illinois Division of Services for Crippled Children, local tuberculosis control boards, visiting nurse associations, infant welfare services, school systems, and industries. Coordination of services by these agencies is spotty, and overlapping and duplication occur. All employ nurses.

Community health nursing requires special knowledge and competence not included in the programs of nursing schools in hospitals or community colleges. The requisite sciences (biological, including epidemiology and preventive medicine, and behavioral) and nursing theory and guided clinical practice in health services outside of hospitals are available in nursing programs organized in universities and senior colleges. Only the graduates of these programs qualify for appointment to positions as public health nurses -- qualifications advanced by the American Public Health Association and the American Nurses' Association and adopted by civil service commissions in most parts of the United States.

Illinois' community health services employ about 3,500 nurses. Of this total, 1,100 work in governmental and private agencies providing care and instruction in clinics and homes (local and state health departments, visiting nurse associations, etc.), 1,000 serve under boards of education exclusively for work in schools, and 1,400 work for industrial firms in their health services. Shortages of nurses in these fields are difficult to determine because both numbers and qualifications must be taken into account. For a clear picture of staffing (quantitative and educational), information for public health nurses, school nurses, and industrial nurses should be examined separately; but separate statistics are difficult to obtain. School nursing services are often included in the functions of public health nurses employed in health departments and voluntary agencies.

By any measure, Illinois' present supply of nurses employed in community health services is below the U.S. average. In numbers, the public health nurse-population ratio reached 13.3 per 100,000 population in Illinois in 1964, a ratio exceeded by one-half of the other states in 1937; by 1964 the average among the United States was 16.2 public health nurses per 100,000 Americans. Reports of budgeted positions vacant tell little about the difference between present supply and need. Many areas of the state have no community health service or only partial coverage. Not all boards of education employ school nurses, and non-public schools usually have no school nursing services at all. The fact is that there are not now enough positions provided to approximate anything near those that would be required to equal provisions even in the average of the other states.

As for industrial nursing services, those businesses which provide in-plant services reported no great discrepancy between nurses employed and budgeted positions. Whether more plants ought to have nurses or those with health services should employ more are judgments requiring greater study than was possible for the Commission to undertake.

Assuming qualifications of those rendering the service to be one criterion of quality of the services rendered, Illinois' community health nurses are serving under the great handicap of little or no specific preparation for the job to be done. Fifty-two per cent of those in health departments, visiting nurse associations, and other public health services, had no education of any kind beyond a hospital or community college nursing program. School nurses, no doubt prompted by state certification and salary improvement requirements, had made greater progress toward meeting qualifications for their jobs; only 36 per cent of school nurses had no preparation beyond hospital school or community college nursing programs. Industrial nurses as a whole present very limited qualifications for community health nursing in the broad setting; only 9 per cent of them had training of any kind beyond their hospital school or community college.

Though there is lag in some parts of the state, the salaries and other benefits of school nurses and industrial nurses have kept pace with developments in the community and are fairly attractive. Salaries for nurses employed in health departments, visiting nurse associations, and other public health services have lagged behind those of hospitals, schools, and industries. Readjustment upward is urgent if these services are to compete, and those salaries must be sufficient to attract an increasing number of college graduates in nursing who alone are qualified for the practice of modern community health nursing.

Community health services could be at the threshhold of a renaissance comparable to the developments of the 1930's, when services through community health agencies massively attacked and largely controlled communicable diseases, especially in children . The increase in community health agencies in Illinois and elsewhere suggests an expansion of their services for the active promotion of health and the delay of physical and mental decline in the chronically ill and aged. Again, skilled, knowledgeable public health nurses will be central to both quantity and quality of those services. The Standing Committee on Community Health Nursing of the Commission makes explicit what must be done if Illinois is to have adequate community health services. Illinois' citizens, like other Americans, will probably press demands for such services, demands now reenforced by funds to pay for them through Medicare, Medicaid, and other sources.

## Private Duty Nursing

The oldest form of nurses' occupation is "private duty " or private practice in which nurses are engaged by the patient or his family to care for him only. Thirty years ago most registered nurses (80 percent) were engaged in private duty, but the expansion of hospitals during and after World War II gave

greater opportunity to nurses for more regular and, to many, more stimulating employment than private duty afforded. The decline in numbers of nurses in this field continues; between 1962 and 1966, private duty nurses decreased from 11 per cent of all active registered nurses in Illinois to 7 per cent in 1966. That further decline can be anticipated is suggested by the fact that less than one-fourth of them are under 40 years of age and one-fourth are over 60 years old. (See Table 19)

That private duty nursing service is still needed to some degree is suggested by reports that Illinois professional nurses' registries were unable to fill 53 per cent of the calls received. These went unfilled or were cancelled before an available nurse was found.

Earnings of private duty nurses are low, contributing to decreasing attractiveness of the field. Even nurses desiring to work regularly find their income substantially below that of nurses working in any other field. Though the daily fee of private duty nurses is generally only slightly higher than the daily salary of hospital nurses in the same area, the latter have many benefits not enjoyed by private duty nurses: regular income during illness and vacation, insurance and retirement benefits. To patients and families who must meet the bills, private duty nursing is expensive and often sought only in extremis.

Private duty nurses have a special problem of maintaining competence. Trained as generalists, primarily through hospital schools and often some time ago, they are frequently retained to care for a patient with highly complex therapy requiring specialized nursing knowledge and skill attuned to the specialized medical or surgical interventions prescribed. They are often called upon to be "masters of all trades" -- an impossibility in the modern hospital and medical world.

The future of private duty nursing is in doubt unless it is redirected. It appears unlikely now that younger nurses in large numbers will be available to replace present-day private duty nurses as they retire. Slowing the decline will require changes both in the nature and the structure of private duty nursing. If some private duty or private practice is necessary, as the Commission believes it to be, this service, like others, may have to become specialized (for example, cardiac nursing or neurological nursing) or be redefined as watchful rather than therapeutic care. It may also have to be made available through a mechanism allowing greater regularity of employment, perhaps through means suggested for other nursing services in the recommendations of the Standing Committee on Community Health Nursing.

## Nursing in Doctors' Offices

A relatively small number of nurses have always been employed in doctors' and dentists' offices, and the proportion of all active registered nurses so employed has stayed remarkably constant both in the United States and in Illinois. Since 1949 the proportion of all employed nurses working in doctors' offices has varied only between 8 per cent and 8.8 per cent nationally. In Illinois it has been constant at 9 per cent. In 1966, 2,900 registered nurses

Table 19 . Field of employment of all R.N.'s presently working in Illinois, by age, 1966.

SOURCE: Licensure renewal questionnaire designed by American Nurses' Association. Data obtained from Illinois Department of Registration and Education for renewals in 1966.

were employed in Illinois doctors' offices. Their services were augmented by secretaries, bookkeepers, receptionists, technicians, medical assistants, licensed practical nurses, and aides whose number more than doubled the number of nurses employed. Though there are reports of vacant positions for nurses in doctors' office staffs, the need for clerical staff seemed greater. In the absence of specifically budgeted positions, firm estimates of present additional need are difficult but would probably not exceed 20 per cent for either registered or practical nurses.

Nurses working in doctors' offices tend to be comparatively young; almost half of them are under 40 years of age. Almost three-fourths of them are married and, presumably, find the days and hours of a doctors' office practice congenial to their home obligations. Most (84 per cent) have been graduated from hospital schools and have little or no education beyond that.

Salaries paid office nurses have, on the average, been slightly below those paid hospital staff nurses. Information available to the Commission indicates that the recent increases in hospital nursing salaries have not been matched for doctors' office staffs.

The future demand for and nature of office nursing will be determined by the supply of doctors and the nature of their practice. At the present time, the State Board of Higher Education is considering plans that will eventually increase the number of doctors in Illinois. Assuming that medical discovery and progress and the demand for medical care will expand at least in proportion to population growth, further specialization in medical practice seems inevitable. Furthermore, nurses, the only other professionals trained for the care of the "whole" patient, are likely to find themselves working more intimately with patients and to be doing for them many of the things now considered medical practice. Clinical specialists in nursing could become allied more closely with doctors in patient care than ever before, and this would dramatically change both doctors' office practice and nursing therein.

## Nurses Who Teach

Nursing schools constitute both an employer of nurses and the system which prepares young people to become nurses and to obtain further education for advancement within the profession. The most critical shortage of nursing in Illinois and elsewhere is among nurses educationally prepared to plan, direct and teach in today's variety of nursing education programs. Without sufficient qualified, imaginative, dynamic educational leaders and teachers, Illinois cannot produce the practitioners needed to meet the nursing needs of its people.

In 1966, 1,271 registered nurses reported being employed in schools of nursing in Illinois - about 4 per cent of all active nurses. This number falls far short of requirements. Budgeted positions must be largely filled before schools can open each fall, hence the shortage shows more dramatically in the qualifications (or lack of them) of those doing the teaching than in the numbers of

vacant posts. Almost one-fourth of the teachers in Illinois nursing schools have little or no more education than they received in the nursing program in their hospital school. One-half have earned baccalaureate degrees. Only 27 per cent have earned master's degrees -- the only level of education that provides either training in planning and methods of instruction or advanced learning in the area of nursing to be taught.

Salaries for teachers in nursing schools have risen markedly in the past several years, and they do reflect differences for educational preparation and experience.

Nursing education will continue to require relatively small numbers of nurses, but much better and longer education must be achieved before they begin to teach. The master's degree should be the minimum qualification for teaching in any technical or professional program and for directing practical nursing schools. University teachers of nursing must present qualifications comparable to those expected in other fields. Unless faculty qualifications are high and required, prospective nurses, who now experience more rigorous education through elementary and high schools, will find nursing programs dull, even irrelevant.

## Changing Patterns of Nursing Education

Nursing education in Illinois, as elsewhere throughout the country, is the victim of its own success in resisting changes that have affected every other field of education for a profession. Inexorably, each of the others has been converted from proprietary and/or less-than-college programs into university courses. Supported both by public and professional views of interdependence of nursing education and hospital service, the hospital school has been maintained as the cornerstone of nursing education. Changes in the education of women and, especially, the vast increase in young women college bound were overlooked. As stated before, Illinois nursing schools ten years ago attracted more than 9 per cent of all girls graduating from high schools; now the proportion approximates 6 per cent. During the same decade, women's admissions to college have increased more than 230 per cent. Indeed, an absolute decline in nursing school enrollment was prevented by the increased number of college-age girls and by the increased enrollment in nursing programs of senior colleges, universities and community colleges.

The mounting costs of quality education everywhere affected nursing schools as well. For a decade, the hospital literature has reported many studies of the cost of and deficits in the operation of their nursing schools; hospital administrators as well as others raised the question of the justice and wisdom of taxing patients and/or health insurance funds for meeting educational costs. Gradually the public has begun to listen and increase funds for nursing education in senior and community colleges which are supported by educational taxes and contributions. Interest and support of nursing education in community colleges in Illinois were quickened by the five-year demonstration program (1963-1968)

funded by W.K. Kellogg Foundation.

There seems little doubt that nursing education is following all other preparatory education for professionals and technicians into the higher education system of the country. The problem is to assure an orderly transition from the hospital-centered system of the present to senior colleges, universities and community colleges. Hospital schools that can attract sufficient students and find resources to provide adequate education must continue in the public good. Meanwhile, local planning for conversion throughout the state is needed.

The differentiation of professional and technical nursing practice, which has now been defined by the American Nurses Association, requires educational implementation through both senior and community colleges in close association with hospitals and other health agencies appropriate to the goals of each. Education for professional nursing in the senior colleges and universities must be rigorous in both the biological and behavioral sciences. Specialty education at the master's degree level should be in close association with the education of physicians and other health professionals, thus beginning at school the kind of team learning and working relationships so necessary to effective patient care and community health services.

Progress and improvement in any field evolve from the research process, imagining better ways and testing their merits in practice. Nursing services have too long been handicapped by inattention to such research and it is time to overcome this lack. Qualified nurse clinicians in hospitals and community nursing services, as well as faculties and graduate students of nursing in universities, should undertake it.

The Standing Committee on Nursing Education addressed itself to the critical problems confronting the nursing education system in Illinois, and its recommendations are urgent. In proposing a blueprint for educational action to be accomplished by 1980, the Committee reminded the Commission that expansion of resources for nursing education cannot alone assure adequate nursing services in 1980. Accompanying the expansion recommended must be other and simultaneous efforts to:

1. Increase the patient care productivity of available nurses by removing from their purview all non-nursing support functions;

2. Increase substantially the clinical practice responsibilities of professional nurses;

3. Create economic rewards, interprofessional involvement and recognition, and social image sufficient to attract enough recruits and to hold nurses for a lifetime career which they interrupt only temporarily for home and child-rearing responsibilities;

4. Test and apply in health services, including nursing services, all promising electronic equipment and modern administrative tools.

These, within every organization employing nurses, must be maximized and combined with expansions in nursing education if our present shortages are to be overcome and our growth over the next decade is to keep pace with future demands for both quantity and quality in nursing services.

[1]The Cumulative Index to Nursing Literature cites no articles dealing with ward or unit managers in volumes 6 through 8 (1961-1963) but cites 18 articles in the next three volumes, 9 through 11 (1964-1966).

For an Illinois experience, see Brady, Norman A., et al., "The Unit Manager," Hospital Management, 101, 6 (June 1966), 30-36.

[2]New roles are being worked out not only in hospitals but in community health. Nurse midwives practicing with obstetricians in Boston hospitals, nurses in charge of well-child care in association with an experimental pediatric service in Colorado, nurse specialists in intensive cardiac care units are examples. See also:

Aldrich, C.K., "General Practice and Specialization," Journal of Medical Education, 41, 9 (September 1966), 844-49.

Reiter, Frances, "The Nurse Clinician," American Journal of Nursing, 66, 2 (February 1966), 274-80.

[4]Concern with increasing nursing productivity through automation can be assumed from the numbers of citations on "automation" listed in the Cumulative Index to Nursing Literature: 17 in the three volumes (6-8) covering the years 1961-1963, and 86 in the next three volumes (9-11) covering the years 1964-1966. Sample articles:

Rosenthal, Marcia., "The V.A.s New Automated Hospital," Hospitals, 40, 12 (June 16, 1966), 50-57.

Sherman, Roger. "Computer System Clears Up Errors, Lets Nurses Get Back to Nursing," Hospital Topics, 43, 10 (October 1965), 44-46.

A note of caution is introduced by a distinguished medical administrator:

Bluestone, E.M., "Who Pays Price of Automation?" Hospitals, 39, 19 (October 1, 1965), 104-112.

# CHAPTER III

## THE ILLINOIS PLAN FOR NURSING EDUCATION

## 1968-1980

Primary recommendations relating to nursing education have been incorporated in Chapter I of this report. The plan for accomplishing the goals of nursing education is included in detail in this chapter because of its singular importance. It will be referred to as the "blueprint" but it is actually a plan for planning, based on information provided in background papers; a survey of applicant, enrollment and faculty trends in Illinois schools of nursing, 1964-1967; recommendations from the other standing committees of the Commission; criteria for educational programs set forth by the National League for Nursing and the Illinois Department of Registration and Education, and study of population, health care and education trends and projections.

The plan is not intended to be the final word on what is to be; it is not intended to close schools or reduce the supply of any type of nursing practitioner; it is not intended for today. It is intended to prevent schools from acting alone and precipitously in their attempts to evaluate trends and solve problems; it is intended to show possible movement that might well occur between now and 1980.

Through the plan the Commission wishes to promote a systematic approach to the development of nursing education. The plan recognizes that this must begin at the community or area level if it is to be effective. The community planning areas suggested in the blueprint may not be feasible, or they may change in concert with those of other health and education planning mechanisms. Whatever the boundaries of the planning area may be, the Commission recommends that, to be effective, the planning process must include an evaluation of:

1. Local needs for nursing services and a definition of the numbers of personnel at each level of preparation needed to provide this service.

2. Availability of educational facilities.

3. Appropriateness of clinical experience available for nursing students.

4. Ability to recruit and retain faculty.

5. Potential for recruitment of students.

Nursing education planning areas in Illinois which are referred to in the blueprint are shown on the map which follows.

## Summary of Blueprint

The proposed plan predicts one or two doctoral programs, six programs at the master's level, 18-20 baccalaureate, 32-40 technical and 33 practical nursing programs.

It is impossible to predict the degree to which this number of educational programs will meet the demand for numbers of nursing personnel for 1980. Many of the factors which will make the difference are not controlled by nursing education.

The ratio of 440 R.N.s to 100,000 population for Illinois could be challenged. If results of utilization studies are applied, if the organization and staffing of health services are studied and more efficient systems developed, if mechanization and computerization even begin to have the impact on health services that they have had on other segments of our society, we may need significantly fewer nurses than required by this ratio.

The number of new graduates needed each year to reach any given ratio of nurses to population may be reduced if:

1. We retain more prepared nurses in the field. More nurses view nursing as a lifetime career, a higher percentage of all married women are working, and our economy encourages the trend.

2. We are able to attract increasing numbers of inactive nurses back to work in nursing. There are several forces which should have positive influence on the problem, and the same factors that increase retention should apply here. In addition, the emphasis on increasing availability of refresher courses to prepare nurses for re-entry plus the improved economic returns of nursing will have positive influences on reactivation.

The committee on education believes the goal for 1980 should be one graduate from a baccalaureate program for every two graduates prepared for technical practice. It is difficult to be so optimistic as to believe that baccalaureate programs can be developed and expanded rapidly enough to reach this goal. Because facilities are expensive to build and faculty are scarce, the decision to develop the relatively small number of programs recommended above appears wiser than attempting to increase graduations by starting many small programs. To graduate even 1,000 baccalaureate nurses per year, the twenty predicted schools will need to aim for average total enrollments of over 300 per program. To graduate 2,000 technical nurses per year, the forty hospital and junior college programs will need to average between 100 and 200 students per program.

It is obvious that the problem is still larger than nursing education and practice, and that coordinated community planning for both educational resources

and health services is essential.

The Commission has prepared comprehensive "profiles" of each of the 102 counties in Illinois, including such detailed information as size, degree of urbanization, population, per capita and per household income, numbers of public aid recipients, educational facilities (including nursing schools), college-going index of population, number of nurses (active and inactive, number per 100,000 population, educational preparation of employed nurses by field of employment and type of position, nurses in public health work by type of agency), number of physicians and type of practice, hospitals and extended care facilities and their bed capacities, and services for nursing care of the sick at home.

These profiles will be available to assist future local or area and state planning activities.

| I. Chicago | Chicago | Diploma | Roseland Community Hospital | No | See above |
| | | Diploma | South Chicago Community Hospital | Yes | See above |
| | | Baccalaureate and Master's | St. Xavier College | Yes | Continue and enlarge baccalaureate. Consider broadening master's program. |
| | | Diploma | Michael Reese Hospital and Medical Center | Yes | Continue; assess feasibility of eventual conversion to a baccalaureate program in a suitable university. |
| | | Diploma | Ira J. Goldberg School, Mr. Sinai Hospital and Medical Center | Yes | Continue; plan with West Side Junior College and the University of Health Sciences for transition. |
| | | Diploma | Cook County | Yes | Continue; plan with West Side Junior College, University of Health Sciences and University of Illinois for transition and use of facilities. |

| Region | City | Type of Nursing Program 1967 | School | Accreditation NLN | Recommendations |
|---|---|---|---|---|---|
| I. Chicago (continued) | Chicago | Diploma | Hospital of St. Anthony de Padua | No | Continue, but plan together with the junior college system of Chicago for future transition to large Associate Degree program in nursing. |
| | | Diploma | St. Bernard's Hospital | No | |
| | | Diploma | St. Anne's Hospital | Yes | |
| | | Diploma | Swedish Covenant Hospital * | Yes | |
| | | Diploma | St. Mary of Nazareth Hospital | Yes | Continue; do joint future planning with the junior college system of Chicago |
| | | Diploma | St. Elizabeth's Hospital | Yes | |
| | | Diploma | Walther Memorial Hospital ** | Yes | Continue if feasible. Join with St. Mary of Nazareth and St. Elizabeth's in planning with junior college system of Chicago to meet area needs. |
| | | Diploma | Ravenswood Hospital | Yes | Continue; plan with Amundsen-Mayfair Junior College for eventual transition of nursing program |
| | | Diploma | Illinois Masonic Hospital | Yes | |
| | | Diploma | Augustana | Yes | Continue; plan with Chicago Junior College System for eventual transition. |

* Converting into North Park College baccalaureate program.

**Did not admit class in September 1967 because of low enrollment; evaluating feasibility of continuance.

| Region | City | Type of Nursing Program 1967 | School | Accreditation NLN | Recommendations |
|---|---|---|---|---|---|
| I. Chicago (continued) | Chicago | Diploma | Columbus Hospital | No | Plan with Chicago Junior College system for eventual transition. |
| | | Diploma | Chicago Wesley Memorial Hospital | Yes | Continue; engage in planning with Evanston Hospital for baccalaureate and master's programs at Northwestern University and with the Chicago Junior College System for associate degree nursing education in "Near-North" Chicago area. |
| | | Diploma | James Ward Thorne, Passavant Memorial Hospital | Yes | |
| | | Associate Degree (1968) | West Side (Crane) | - | Expand system to more than double present estimate of 400 graduates per year by 1980. Coordinate planning with present diploma schools and a variety of clinical resources. |
| | | Associate Degree | Amundsen-Mayfair | - | |
| | | Associate Degree (1968) | Southeast Junior College | - | |
| | | Practical | Chicago Public Schools Practical Nursing Center | Yes | Continue |
| | | Practical | Practical Nurses Training Program, Chicago Board of Education, MDTA | - | Plan for permanent facility and financing. |

| Region | City | Type of Nursing Program 1967 | School | Accreditation NLN | Recommendations |
|---|---|---|---|---|---|
| I. Chicago (continued) | Chicago | Practical | St. Francis X. Cabrini | - | Continue and plan with Chicago Board of Education for future transition to that system. |
| | | Baccalaureate and Master's | DePaul University | Yes | Continue and expand, with special attention to urgent need to enlarge master's program in administration of nursing services. |
| | | Baccalaureate and Master's | Loyola University | Yes | Continue and expand. |
| | | Baccalaureate | North Park College | No* | Expand as soon as program is old enough to secure the accreditation anticipated. |
| | | Baccalaureate and Master's | University of Illinois | Yes | Continue and expand; give priority to establishment of master's program in administration of nursing services. Increase clinical specialties at master's level. Start doctoral program designed for nurses as soon as feasible. Share experiences in newly developed arrangements with Presbyterian-St. Luke's with others across the state. Continue to create and test new ideas for cooperative arrangements with other facilities and agencies. |

* too recently established.

| Region | City | Type of Nursing Program 1967 | School | Accreditation NLN | Recommendations |
|---|---|---|---|---|---|
| I. Chicago (continued) | Chicago | - | University of Chicago | - | Start baccalaureate and master's programs in nursing with all possible speed. |
| I. Chicago Metropolitan Area, Far West and South | Joliet | Diploma | Silver Cross Hospital | Yes | Continue; plan together with Joliet Junior College and St. Francis College for future changes in nursing education system. |
| | | Diploma | St. Joseph's Hospital | Yes | |
| | | Practical | Joliet Township High School | - | Continue |
| | Elgin | Associate Degree | Elgin Community College | - | Continue and expand. |
| | Aurora | Diploma | Copley Memorial Hospital | Yes | Continue; give leadership to community planning with junior college for future transition to associate degree nursing program. |
| II. Northern Illinois | Rockford | Diploma | Rockford Memorial Hospital | Yes | Continue. Lead community planning with Rockford College for baccalaureate program and Rock Valley Junior College for large central associate degree nursing program. |
| | | Diploma | Swedish American Hospital | No | |
| | | Diploma | St. Anthony's Hospital | No | |

A Proposal for Redirecting Programs of Vocational Education in North Carolina.

North Carolina State Dept. of Public Instruction, Raleigh
MF AVAILABLE IN VT-ERIC SET.
Pub Date - Oct63 36p.

*EDUCATIONAL PLANNING; *VOCATIONAL EDUCATION; *COMPREHENSIVE HIGH SCHOOLS; EDUCATIONAL NEEDS; COMPREHENSIVE PROGRAMS
NORTH CAROLINA

This proposal is directed at meeting the needs of the 81 percent of the State's youth who do not go to college by establishing comprehensive high schools within the State's education system. The schools would prepare students for college, or for entrance into technical occupations or a trade after graduation from high school or at the termination of a post-high school training program. The plan for the schools calls for compulsory orientation to vocational education at the ninth grade level through the course, Introduction to Vocational Education, followed in grades 10, 11, and 12, by a college preparatory, a technical assistant, or a trade or business program. From funds made available by the Clark-Long Act, the course, introduction to vocational education, was organized and introduced into 25 schools and correlated with English, math, and science courses in 15 additional schools. In five other schools, a comprehensive vocational program, consisting mostly of offerings in the trades areas, was initiated into grades 10, 11, and 12. Funds were requested to establish "pilot schools" for developing six technical assistant and modernizing and diversifying five trade programs as training centers for teachers responsible for starting such programs in the 45 experimental schools. Funds were also needed for activities essential to the effective operation of the comprehensive high school: (1) teacher training, (2) curriculum development, (3) research, (4) cooperation with industry, business, and public bodies. A proposed 3-year budget starting in 1964 and a timetable are included. (MM)

## INTRODUCTORY SYNOPSIS

North Carolina is rapidly undergoing changes which promise to have a tremendous impact upon life as it is now known within the State. Automation is moving into tobacco production and into textiles. Together they comprise the mainstay of the economy of North Carolina. This new technology will bring about an enormous reduction in the number of jobs for the people who are relatively low on the socio-economic and educational levels of our society. Here is the prospective army of the unemployed. At the same time industry and business are moving into the State, public services are expanding, creating a tremendous demand for personnel trained in the trade and technical areas. Our major problem is to balance unemployment with employment, thus maintaining a population of occupational probity and social excellence. This Proposal tells how we plan to solve it.

Up until the present time, the schools of North Carolina have put major emphasis on preparation of the youth of the State for college entrance. This has been done <u>in spite of the fact that 81 per cent of the youth of North Carolina do not go to college</u>. Vocational education has been present in the schools of North Carolina for many years but it has been a reflection of the agrarian economy of the State, meaning that it has consisted for the most part of Vocational Agriculture and Home Economics. In this age of industrialization, specialization, and computation, vocational agriculture and home economics are not enough. Vocational education becomes just as sterile and useless as traditional academicism if it does not keep pace with the life of the world. It must move ahead of these changes in our society. By diversification it must serve as an impetus to these changes rather than as a mere reflection of the past.

The General Assembly of North Carolina has shown its interest and concern by the passage of an act designed to support an experimental program. The first step

has been taken by the establishment of a new course, "Introduction to Vocational Education," in the ninth grades of forty-five schools. The second step involves the development of new trade courses. However, a shortage of funds has severely hampered the operation. Only the existing, traditional courses have been set up in five schools. No new trade courses, reflecting modern changes, have been developed, nor are there any funds available for such development.

As efforts have been made to implement this program, an additional major need has arisen. The high school must offer the specialized education which, upon graduation is necessary either for entrance into the post-high school technical programs or for immediate entrance into the technical assistant labor market. This technical assistant labor market encompasses industry, business, health services and any other occupations open to high school graduates who possess competencies which involve both manual skill and theory of operation.

The solution to the problem is the establishment of comprehensive high schools within the educational system of North Carolina. The comprehensive high school, as viewed by the educators of North Carolina, would include (1) preparation for college, (2) preparation for entrance into technical occupations either upon graduation from high school or at the close of a post-high school training program and (3) preparation for entrance into a trade, again, upon graduation from high school or at the termination of a post-high school training program. All of this would be based on a good introductory course which would help students to make more realistic vocational choices. Following is a diagram depicting the ideal comprehensive high school, along with notes indicating progress in approaching it in practice.

## A Good Comprehensive High School

| Curricula | College Preparatory | Technical Assistance | Trade or Business |
|---|---|---|---|
| | College or Community College | Industrial Education Center or Technical Institute or job | Industrial Education Center or Technical Institute or job |
| 12 | | | |
| 11 | [2]The usual college preparatory program (already in existence in all high schools) | [3]The technical assistant program (not yet organized) | [4]The usual trades, agriculture, trade and industry, business, home economics, with such changes and additions as required by the new technology, (Agriculture and home economics exists in most schools; standard trades in only a few schools. The new technologies are non-existent.) |
| 10 | | | |
| 9 | [1]Introduction to Vocational Education (already in existance in 45 schools) | | |

1. This would be compulsory orientation for <u>all</u> pupils.

2. For college-bound pupils, and also combined with 3 and 4, for "double-purpose" students.

3. For students aspiring to become technical assistants, but who may continue their education in Industrial Education Centers or Technical Institutes.

4. For students aspiring to become craftsmen, or who may continue their education in Industrial Education Centers or Technical Institutes.

N.B. The program should be so flexible that students can graduate in less than

normal time, or can shift at any time from one program to another.

N.B.B. This diagram should be interpreted in terms of Section V of the Proposal, "The Comprehensive High School - The Ultimate Goal."

Funds are being requested to develop the technical assistant and to modernize and diversify the trade programs in a small number of "pilot schools" (six schools for the technical assistant areas and five schools for the trade areas). Then, teachers who must begin the development of new technical assistant and trade courses in each of the original forty-five schools would be apprenticed to the appropriate "pilot school" for purposes of disseminating the information obtained in these "pilot schools" throughout the State.

Concurrent with the needs noted in the organization of the comprehensive high school are the activities which are essential to its effective operation, and for which funds are necessary:

Teacher training of a high and special character.

Curriculum development of a kind consonant with the development of modern industry, business, and public service.

Research of a peculiar depth and practicality.

Cooperation with industry, business, and other public bodies.

With a realization of the foregoing proposals, North Carolina should be well on its way toward the establishment of good comprehensive high schools.

## SECTION II

## PRESENT EDUCATIONAL FACILITIES IN NORTH CAROLINA AND THE NEEDS THEY SUGGEST

### Need for More Realistic Curricula

Out of every 100 North Carolina pupils who have been in the fifth grade of elementary school, 19 enter college and 6 graduate from college!! What becomes of the 81 who never tread the halls of Academe? They constitute our problem.

The following figures are authentic.

The June, 1962, graduating class from the public schools of North Carolina comprised only 51.8 per cent of those who were in the fifth grade during the 1954-55 school year. Thus 48.2 per cent dropped out along the way. Thirty-seven per cent of those who graduated entered college. The colleges say that only about one-third of those who enter college graduate. Thus, for each 100 who enter the fifth grade, fifty-two finish high school, nineteen enter college, and six graduate from college. If nineteen of the original 100 enter college, than eighty-one do not. What becomes of the eighty-one?

The citizens of North Carolina provide millions of dollars each year to support fifteen four-year State institutions of higher education. They endow and pay tuition fees to numerous private colleges. They feel a keen sense of responsibility for the necessity of enabling every individual boy and girl to develop their potentials in so far as they be within the scope of college work. But what about those 81? They constitute the vast majority of our fellow-citizens. Here lies our greatest hope for workers in this new world. Here are the opportunities for higher per capita income and a rising level of living. Here are the pulsing human beings that make up so large a part of our citizenry.

All this is democracy in action — the individual developing in a community — especially the 81 who will not enter college.

The development of these new educational opportunities requires a high-quality, realistic curriculum. High quality can and must pervade vocational and technical programs just as it does most English, mathematics, and social studies programs.

The Vocational Program

Traditionally, the high school program in North Carolina has offered only two vocational programs. These are Agriculture and Home Economics. Thus, these have been flooded with students who, in many cases, were not really interested. Often they almost destroyed the effectiveness of the course for those who were interested. The teachers are to be commended for broadening the content of their courses to make them as meaningful as possible to those enrolled; yet, realistically, more courses are needed.

Immediate attention must be given to educational programs developed to meet the needs of the 81 per cent of our youth who will not enter college. Conant in his books on The American High School, Education in the Junior High School Years, and Slums and Suburbs, and our National educational leadership regard rapid expansion in these technical and trade areas as imperative.

The College Preparation Program

It is safe to assume that every high school in North Carolina has a valid and effective college preparatory program which enables the 19 per cent to enter college. Is it not mandatory that every such school should also provide an equally valid and effective preparatory program to enable the 81 per cent to enter Community Colleges, Industrial Education Centers, Technical Institutes, or occupations? Obviously, this should be a "technical assistant" or "trade" program, developed on the basis of "The Changing Pattern of Life in North Carolina Outside of School," detailed in Section I of this paper.

## The Pressure for Science

Immediately following World War II, elementary and secondary schools received wide-spread public attention. Such terms as "reading readiness" and "school reorganization" became common terms, even among laymen. The arrival of space satellites and astronauts upon the scene during the 1950's focused attention upon science education. Movements toward an international social order led to greatly increased emphasis on languages. Advancements in technology, automation, and increased availability of goods and services, coupled with an economic and social cold war, gave impetus to a rapid increase in emphasis on "getting a college education." Some people were saying, "Everyone should go to college."

## Vocational Education Becomes Imperative

Now, during the early 1960's, it looks as if society had suddenly realized that people must earn a living, that everyone should not make college his aim, and that vocational and technical education is, at present, perhaps, the most important phase of all education.

In other words, it has now become fashionable to display interest in vocational and technical education and its relationship to unemployment. As evidenced by recent articles in Harper's and Look Magazine, Sylvia Porter's articles, and the report of the Panel of Consultants on Vocational Education to the President, People are certainly interested. Some have been critical in their evaluations, some almost wholly negative, while others have been positive. It is well, nevertheless, that the public has become aware:

1. that people must earn a living,
2. that people must have training for earning a living, and
3. that vocational and technical education is the foundation for earning a living for the majority of our citizens.

Industrial Education Centers

In North Carolina, there has been a definite educational gap between the high school diploma and the baccalaureate degree. Many young men and women want and need more education than they get in high school, yet do not aspire to graduation from college. About four years ago North Carolina made a move toward filling this educational gap — the development of 20 strategically located Industrial Education Centers. The oldest of these Centers was established four years ago, yet last year approximately 45,000 individuals were enrolled. Perhaps this is not too distant from the student population on the three campuses of the University of North Carolina. We predict that within five to seven years they will attract more people than are enrolled in all 15 State-supported four-year colleges.

No, all these trainees are not four-year students, seeking degrees. Their aim is to become skilled craftsmen and technicians. They are citizens of North Carolina developing their talents to the fullest of their potential. These Centers have already begun to make a tremendous impact. What is a technician? An engineer devotes the most of his time, energy, and effort to dealing with ideas and concepts - theory. A craftsman devotes most of his time, energy, and effort to manipulation. A technician is about half-way between the craftsman and the engineer. He possesses sufficient knowledge, understanding, and ability in the area of theory to enable him to communicate effectively with the engineer, and sufficient ability in the manipulative area to take the ideas and concepts of the engineer and apply them in a laboratory or industrial setting. The Industrial Education Centers do not train engineers - that is the University's job. The Industrial Education Centers deal with both other areas - the training of skilled craftsmen and technicians. (This complex of Industrial Education Center's has since become a state-wide system of Community Colleges, Technical Institutes and Industrial Education Centers.)

Purpose of Public Schools

It is often said that public school programs must react to at least two kinds of changes, these being economic and sociological. There is also the realization, however, that educational programs must be more than "reactionary," even more than sensitive and responsive. Educational programs should be at the leading edge of a changing society, that is, schools should provide direction and leadership in a changing society, rather than to follow passively the current trends.

Another view of the public schools is that they are promoters of the learning process, that they bring about changes in the behavior of people and changes in their (a) knowledge, (b) understanding, (c) skill or ability "to do" ..., and (d) attitudes.

A third way of viewing the purpose of the public schools is to regard them as agencies to help "burgeon out" of every individual the best that is within him. Schools should aim toward developing individuals to the fullest of their capacity, irrespective of the area in which one's potential may lie and irrespective of the depth of one's capacity.

Regardless of which of the three approaches is used to explain the purpose of public schools, it appears that public schools should promote and develop:

1. Skill in the manipulation of things (physiological dexterity).

2. Skill in dealing with ideas and concepts, both in the sense of their consequences in action and of their place in a conceptual system (logical analysis).

3. Skill in human relations, including the process of group discussion and cooperation, and in personal relations.

4. Appreciations, in the sense of adequate standards of the good and the beautiful and of sound personal tastes and enjoyment.

Vocational Education and General Education

From a very practical point of view, one might say that public schools exist for

the purpose of affecting life outside of school. Any other practical explanation would be to regard the work of schools as mere "busy work." English is taught in order to affect the lives of students outside of school as is algebra, history, physics, and the various so-called or administratively or legally classified "vocational subjects." The major difference between vocational education and general education is that "vocational courses" are organized and taught in such a manner as to emphasize application outside of school. Interest in emphasis upon immediacy of application appears to be greater within vocational education courses. Thus, general education and vocational education are not entities within themselves, nor are they two separate "worlds;" rather, they should be regarded as a continuum, the only difference being in the degree of interest in, and emphasis upon, immediacy of application.

Summary:

These are the present high school educational resources of North Carolina:

1. A sound elementary school program.

2. Junior high schools whose exploratory, orientation, guidance functions have been sadly neglected, but which are being significently strengthened by the "Introductory Vocational Education" program.

3. High schools which provide.

   (a) A sound college preparatory program.

   (b) Vocational agriculture and home economics on a large scale.

   (c) A very small number of traditional trade programs.

   (d) A small number of business, Industrial Cooperative Training, and Distributive Education programs.

However, courses for technical assistants, and modern trades, are sorely lacking. Hence, the need for setting them up in the high schools.

## SECTION III

## CURRENT EFFORTS TO MEET PRESENT EDUCATIONAL SITUATION IN NORTH CAROLINA

A legislative measure known as the Clark-Long Act was passed by the General Assembly of the State of North Carolina in June 1963. Its purpose was to solve some of the pressing problems of vocational education. An appropriation of one and one-half million dollars was made available to the Division of Vocational Education.

By use of these funds, a three-phase approach is being made to overcome the present inadequacies in vocational preparation of students in our high schools. Each of these phases is a step in a progressive attack upon the problem with which we are confronted, namely, the inability of the schools to provide the necessary education for the 81 per cent of our youth who do not plan to attend college.

These three steps are:

1. The organization and installation of a new course, "Introduction to Vocational Education," in the ninth grade of twenty-five schools.

2. The establishment of this same course in fifteen additional schools, correlated with English, math and science courses.

3. In five schools, in addition to the foregoing, a total comprehensive vocational program is being initiated in the 10th, 11th and 12th grades. Most of the offerings in these five schools have been in the trade areas.

Thus, these three steps have been taken in forty-five schools and, including control groups, over 4,000 students are involved. (See map on following page for location of the forty-five schools.)

Step 1 - Red

Step 2 - Blue

Step 3 - Green

Comment on IVE Course

As with much of our plan, we understand that we are not inventing new educational concepts, but that we are putting good ones into operation on a state-wide scale, under the leadership, sanction and blessing of Governor Sanford and the financial support of the State Legislature.

The IVE course is new in the sense that the old "introduction to vocational education," under various names (occupational information, vocational guidance, industrial arts, exploratory courses, and the like) has been brought up to date, adapted to North Carolina conditions, and generally modernized with a practical, functioning body of knowledge and practice. It mandates the use of all kinds of practical experience in and out of school. It draws upon the so-called academic curriculum and teachers, thus, giving validity to the idea that vocational education is truly part of live functioning general education.

At the same time, we realize that no phase of vocational education, whether exploration, guidance, training, or what not, can be tagged for any one school grade. Receptivity or even urge for vocational education may occur at any age or grade. However, we are placing it in the ninth grade, as the most appropriate for the time being, with the hope that we can make it available for pupils of any age or grade.

Vocational education, in any of its phases, is a continuum. It is no "one-time thing." It is continuous from kindergarten to graduate to professional school. Interest, motivation, drive, temperament often come early and must be served. Activity starts at birth. Postponing this activity phase (whether it is called industrial arts, practical arts, or just activity) until after high school or junior high school or even after elementary school, is fantastic. It is faithlessness to the youngster and breach of promise to the American society.

Course of Study for IVE

Consultants with experience in four areas (Economics, Science, Education and basic work skills) were asked to submit a suggested course outline for the ninth grade course in IVE. These consultants were:

Dr. Juanita Kreps, Professor of Economics, Duke University
Dr. John B. Chase, Professor of Education, University of North Carolina
Dr. H. E. Beam, Professor of Agricultural Education, North Carolina State
Mr. George West, Director of Vocational Education, New Hanover Public Schools

The result of this request was the combining of the thinking of this group into a tentative course outline which covers the objectives which were stated for this course. This is now available and has been placed in the hands of the teachers.

Research Design and Procedure

In order to evaluate the degree of success of this experimental "Introduction to Vocational Education" program, a complete design of student measurement and testing was developed by Dr. Norman Chansky, Professor of Education, North Carolina State of the University of North Carolina. Pretesting and follow-up testing in the following areas were employed:

1. Student interests
2. Achievement
3. Aptitude
4. Career Knowledge Inventory

The result of these tests will be made available to teachers for use with students as well as for use in evaluation by the project staffs.

Teacher Training for IVE

On July 22, 104 teachers representing the forty-five participating schools registered for the summer school workshop. These teachers included the vocational

teachers from the schools in which an individual approach is being made and also the Vocational, English, Math and Science teachers from all schools in which the team approach is being made. During the summer session, the teachers discussed the need for such an educational approach, the needs of ninth grade youth, the various testing procedures, the socio-economic trends in North Carolina, the evaluation and adjustment of the course of study previously discussed, and other related topics.

The summer school was scheduled as a workshop which included many general sessions, discussion groups, work groups and individual work experiences. The emphasis was placed upon active participation by all concerned. A full-time faculty of four was employed. They were:

Dr. C.C. Scarborough - Chairman, Division of Teacher Education, North Carolina Stat
G. Herman Porter - Department of Curriculum Study and Research
Joan K. Smith - D.E. Coordinator, Wilson Industrial Education Center
E. N. Farnell - Principal, Fuquay Springs High School

This faculty was ably assisted by consultants in various fields. Two of these consultants were: Dr. Donald E. Super, Columbia University and Mr. Marvin Feldman, Vice-President, Cogswell Polytechnic College, San Francisco, California.

The group morale was high, participation was at a maximum and willingness to work was a group characteristic. The summer school session was most successful.

The last week of the summer session was planned to provide assistance to those schools in which the individual approach was to be made. On August 20 and 21, the Principal, Guidance Counselor, and the English, Math and Science teachers from these twenty-five schools were present. They were presented with a report on the activities which had taken place in the four weeks prior to their arrival. This was a most rewarding experience for all concerned.

## SECTION IV

## PROPOSAL

The Vocational Division of the State Department of Public Instruction has determined that the need for technical assistants is great in three occupational areas: (1) health services, (2) industry, and (3) business. It is possible to give this necessary training in the high schools. Upon completion of the course, the graduate can either continue his technical education at an appropriate institution, or he can take a job in industry and receive further job training.

In order to develop a technical assistant program for the use of the forty-five high schools, the following procedure is suggested:

1. Having defined the three educational areas where the need for technical assistant education in the high school exists, we prepose that two schools develop this program for each of the three areas which have been mentioned, thus giving a total of six schools. These six schools would be in three different localities within the State. The schools and localities which are suggested as participants are listed below:

(a) Research Triangle Area — Two schools would be chosen within this area and would develop a technical assistant program in the <u>health services</u> and in <u>industry</u>. Study has shown that a need exists within this area for both of these types of graduates and that employment of such people is highly probable. The two programs would be correlated with the health service facilities and industrial facilities of the area.

(b) The Burlington or Greensboro Area — In this area a need has been shown for technical assistant education within the high school in <u>business</u> and <u>industry</u>.

(c) (Area Not Yet Determined) — A third area will be selected in which technical

assistant education will be offered in the health services and in business. Selection of the area depends upon the support which can be obtained from the health services and business community.

Preliminary visits to these areas and consultation with schools, businesses, industries, and hospitals confirm the fact that the needs described above are realistic. Support for these experimental educational programs has been secured within these areas.

2. These six schools would begin immediately the development of their assigned technical assistant education program. Assistance would be rendered these schools by consultants from the Division of Vocational Education and by leading authorities in the nation. By working closely with these consultants and with a strong local advisory committee, the participating schools would start their course of technical assistant education by the beginning of the second semester or as soon thereafter as possible. Additional assistance would be given these schools by providing the necessary funds for people from these schools to visit the "best" comprehensive programs within the nation.

3. As soon as these schools had begun to offer this technical assistant education, a schedule would be developed which would assign an individual from each of the original forty-five schools to one of these six pilot schools for purposes of practical orientation into the program. Assignment would be based upon the need for that particular technology within the local situation. The expenses of the person who is assigned to one of the six pilot schools would be borne by the project itself. This person would spend two weeks at the pilot school observing and instructing classes under the guidance of the "Master Teacher." He would also talk with students and representatives of industry; and, in general, would learn how to set up a technical assistant education program for his own school. He would then go

back to his school and begin the development of the tenth grade course in technical assistant education.

4. Developmental work in trade courses in the five schools has been described. Assistance is needed in placing this work on a broader educational foundation. These five schools would be used as pilot schools for trade education. New courses and material must be developed, especially in the tenth grade. A schedule of assignment would be derived and a representative of each of the other forty schools would spend two weeks (all expenses paid) in the school which is developing the trade area most reasonable for his school. He would, upon his return to his own school, begin the development of a trade curriculum within the tenth grade.

As can be seen by the steps outlined in the proposal, this is a method for (1) the development of technical assistant and trade curricula in pilot schools, and (2) the diffusion of these programs into the original forty-five schools involved in the experimental program. This, then, is the genesis of a truly comprehensive high school curriculum for North Carolina.

Need for Funds

As noted previously, funds are available and are being used to develop what is described as "Current Efforts." However, this is only an approach to the major objective of organizing completely comprehensive high schools that will serve all the youth of North Carolina. Funds are not available to carry out the various phases of the "Proposal."

In summary, these are the financial needs:

1. Teacher Training. In trade education the first great weakness is the scarsity of highly competent craftsmen who are willing to teach. The second great weakness is the lack of adequate facilities for training them to teach. As has been indicated, North Carolina has very little trade education in any of its high schools. To remedy

the situation, it will have to

(a) induce industry to provide the men, and

(b) train these men to teach.

"Practice teaching under expert supervision," which Conant has emphasized as the vital need for academic teachers, is still more vital for trade teachers. The procedure noted in the "Proposal" is imperative and is expensive.

After actual assignment to "pilot schools," there should be a strong "after-school" (evening, Saturdays, summer) program of in-service education, comparable to that of the National Science Foundation for math and science teachers and the U. S. Office of Education for Counselors. Both the pre-service and in-service programs deserve ample support, such as is not now available.

With some variations, what has been said about the trade teachers also applies to the teachers of prospective technical assistants. Since this is a new field, much experimentation will be necessary.

2. Curricula. For the standard trades much reliable information is available. However, as result of the insistent demands of automation, these trades are changing. Old skills are waning and new skills are developing. Many phases of the need for technical assistants have been studied (as noted in the references to the Bureau of Employment Security Research), but the actual content and methods of teaching the required skills are, for the most part, still to be developed.

So, in both these fields, extensive research and planning are necessary. Funds are needed to do a job that is indispensable for a worthy program.

3. Testing and Research. The program which would be initiated in the six schools must be under constant surveillance and a research program must be developed to ascertain the degree of success which is attained in the program. New techniques of testing must be developed. There must be some way of determining the degree to which

technical assistant programs are truly preparing students for entrance into both occupations and into further technical education at the post-high school level.

4. Cooperation With Industry, Business, and Other Public Bodies. As with all other phases of education, there can be no effectiveness in vocational education unless there is complete cooperation with these persons who control those aspects of life for which the student is being prepared — in other words, trade, business, and public service. For this purpose, advisory committees or commissions (consisting of private and public employers) are indispensable, not only for purposes of advisement, but for

(a) teacher recruitment,

(b) curriculum organization,

(c) cooperative courses — part-time employment and

(d) placement

All this can be effective if expertly and continuously operated — again requiring funds.

## PROPOSED BUDGET

| Items | First Year* | | | Second Year | | | Third Year | | |
|---|---|---|---|---|---|---|---|---|---|
| | Grant | State | Total | Grant | State | Total | Grant | State | Total |
| 1. Administrative Salaries & Wages | 10,750 | 10,750 | 21,500 | 10,750 | 32,250 | 43,000 | - | 43,000 | 43,000 |
| 2. Consultants Fees & Travel | 2,500 | 2,500 | 5,000 | 2,500 | 7,500 | 10,000 | - | 10,000 | 10,000 |
| 3. Supplies & Materials | 500 | 500 | 1,000 | 500 | 1,500 | 2,000 | - | 2,000 | 2,000 |
| 4. Postage, Telephone, Telegraph | 625 | 625 | 1,250 | 625 | 1,875 | 2,500 | - | 2,500 | 2,500 |
| 5. Travel (Staff) | 2,500 | 2,500 | 5,000 | 2,500 | 7,500 | 10,000 | - | 10,000 | 10,000 |
| 6. Printing & Binding | 2,000 | 500 | 2,500 | 2,000 | 3,000 | 5,000 | - | 5,000 | 5,000 |
| 7. Testing & Research | 2,500 | 2,500 | 5,000 | 2,500 | 7,500 | 10,000 | - | 10,000 | 10,000 |
| 8. Operation (Salaries & Travel) | 64,000 | 20,000 | 84,000 | 64,000 | 59,000 | 123,000 | - | 123,000 | 123,000 |
| 9. In-Service Education | - | - | - | - | 72,500 | 72,500 | - | 72,500 | 72,500 |
| 10. Salaries & Wages (temporary) | - | - | - | - | 4,000 | 4,000 | - | 5,000 | 5,000 |
| 11. Equipment & Teaching Materials | 20,000 | 40,000 | 60,000 | 20,000 | 40,000 | 60,000 | - | 60,000 | 60,000 |
| 12. Office Equipment | 1,500 | 1,500 | 3,000 | 250 | 250 | 500 | - | 500 | 500 |
| | 106,875 | 81,375 | 188,250 | 105,625 | 236,875 | 342,500 | - | 343,500 | 343,500 |

*The budget for the first year includes expenses for the period January 1, 1964 to July 1, 1964.

Item I - Administrative Salaries and Wages

The money requested under this item would be used to pay the salaries of the Project Director ($13,000 per annum) and Project Assistant Director ($8,000 per annum) whose job it would be to provide leadership to the entire project. Qualifications for filling these positions would be:

(a) ability to visualize the concept of a comprehensive high school for North Carolina,

(b) ability to project this idea in such a manner as to be practical in the educational situation of North Carolina, and

(c) ability to administer a program of such nature as the one described.

Also included under this item are salaries for two curriculum specialists ($7,500 per annum) whose job it would be to develop new curricula materials particularly for the changing trades courses and also for the technical assistant program. The two secretaries ($3,500 per annum) who are requested would be used to support the four positions already outlined.

Item 2 - Consultants Fees and Travel

Part of this money would be provided to enable the project to draw upon consultants from throughout the nation who are authorities on both the comprehensive high school and on technical assistant education in the high school. These consultants would work primarily with the six high schools. The remainder would be utilized to bring to North Carolina the nations' foremost authorities on trades courses for the trades which are in transition. These consultants would devote their time to assisting the curriculum specialists with the five schools which have already begun work in this area.

Item 3 - Supplies and Materials

This would be used to buy such items as office supplies which would be necessary to carry on the administrative activities of such a program.

Item 4 - Postage, Telephone and Telegraph

This would be used to pay expenses incurred in the communication processes necessary for the promotion of the program.

Item 5 - Travel (Staff)

This would be used to allow the four staff members to visit schools both within the state and throughout the nation in order to meet best the objectives of the project.

Item 6 - Printing and Binding

This would be used to provide for the necessary publication and distribution of those course outlines to be developed for both the trade and technical assistant curricula areas.

Item 7 - Testing and Research

As was outlined in Testing and Research, funds are needed for the development of criteria which will be used to evaluate the total project.

Item 8 - Operation (Salaries and Travel)

Funds are herein requested to provide a maximum of two new technical assistant teachers to each of the six pilot schools. Also a request is made to pay the salaries of one I.V.E. Coordinator from each of the forty-five schools who would spend two weeks in a school which is developing a technical assistant program and two weeks in a school which is developing a trades program. This is a vital part of teacher training as referred to heretofore.

Funds are requested for each of the twelve technical-assistant teachers (two from each of the six schools) to visit the best comprehensive high school programs in the nation and also funds are requested for travel and subsistence of the forty-five I.V.E. Coordinators as they are apprenticed for their four weeks to the "Pilot

Schools."

Item 9 - In-Service Education (three weeks)

Two representatives of each of the forty-five schools (I.V.E. Coordinator plus one other individual) would be paid salaries, travel and subsistence for three weeks in order that they might attend a special In-Service Education workshop to be held after the close of the regular school session. The purpose of such a workshop would be to consolidate the ideas gained in the four weeks spent in the "Pilot Schools."

Item 10 - Salaries and Wages (Summer School)

A faculty of approximately five people would be necessary to conduct the In-Service Education Session for those participants listed in Item 9.

Item 11 - Equipment and Teaching Materials

Equipment and teaching materials must be provided the six schools which will begin the development of the technical assistant programs. This item would allow each of the six schools to spend a maximum of $10,000 for this purpose.

Item 12 - Office Equipment

This would be used to provide the necessary equipment to furnish the offices for the administrative staff.

## Proposed Timetable

| | | |
|---|---|---|
| November 1 | - | Final selection of six schools |
| January 1 | - | Establishment of advisory committees, selection of instructors, preparation of course outlines, visits to comprehensive high schools throughout nation. |
| February 1 | - | Begin new program in six schools |
| March 1 | - | Begin scheduling of visits by teachers to new programs |
| June 1 | - | Begin summer training of teachers |

## SECTION V

## THE COMPREHENSIVE HIGH SCHOOL - THE ULTIMATE GOAL

Herein are presented what are considered to be the characteristics of a comprehensive high school. It is high schools of such nature that are the ultimate goal of this project.

### Characteristics of a Good Comprehensive High School

It is one thing to list the characteristics of a really good comprehensive high school before you have even seen one, and quite another after having visited dozens. In retrospect the scale of values changes enormously. Elements that at first seemed unimportant later loom up as vital, while other elements that seemed outstanding fade off into insignificance. The present list is ex post facto.

It is an inventory of characteristics that differentiate the good comprehensive high school from the poor one. (It includes only by implication those characteristics that are common, fundamental, to any kind of school. For instance, good methods of teaching, democratic discussions of policy, basic education, training of teachers, adequate housing, and the like. Where they are pertinent to this proposal, they will be discussed later.)

These are the characteristics:

1. A really good comprehensive high school is possible only in a one-high-school community. It is the only high school in the community. It serves all the children, all races, colors, religions. (In North Carolina, social and economic conditions are such that it will be necessary, at least temporarily, to make provisions that will enable two high schools in the same community to cooperate so as to avoid duplication of specialized facilities.)

2. The principal must have had vocational experience or an intimate vocational background, or for any other good reason, he must really understand vocations and be enthusiastic about giving training for them. He must inspire all his teachers, especially the teachers of academic subjects, to support and further the program. (We have already spotted several principals who have these characteristics, and we are certain that we shall find many more.)

3. Some years ago, Lester Nelson expressed, as one of the major educational calamities, the situation when a principal encounters a proposal for a new subject or service, with the exclamation: "I can't program it!" The "person in charge," whether principal, director or superintendent, must be keenly intelligent and must be able "to program" whatever constitutes a valuable contribution to the education of any one pupil. For instance, pupils who desire vocational training of any kind must be programmed first for such work, with the other subjects clustered around that primary need.

In fact, the school should be so flexible that it can function as a double-purpose high school, a school that prepares for both occupation and college. This type of school is described in a later note.

4. The director of vocational education must have all the qualities of the principal, plus high skill in his own trade.

5. All pupils, regardless of their major subjects, or postgraduate plans, must intermingle in the academic classes and in all extra-curricular activities, without restriction.

6. The director of guidance and the counselors must have, in high degree, all the qualities usually attributed to counselors, but with especial emphasis upon their being <u>work-experienced</u> and <u>occupation-minded</u>. One of the great weaknesses of most counselors, is their lack of knowledge about occupations and placement. No matter

how great the variety of offerings of a comprehensive high school, their value will be nil unless the guidance program is one that brings every individual boy and girl under the influence of those offerings for which he has deep interest and high capacity.

At least half the staff of counselors must come out of the vocational division. No high school can be comprehensive if all the members of the guidance staff are academic-minded and vocation-blinded.

7. The school must have a strong "introductory vocational educational program." We already have a course of this type in the ninth grade of forty-five schools in North Carolina. This course is being taught by a vocational teacher and is an elective for both boys and girls. The objectives include helping students:

(a) To develop and analyze their aptitudes and interests.

(b) To understand and appreciate the world of work, the economic system, and the trend of specialization of human activities.

(c) To explore basic skills common to many occupational fields.

(d) To understand and appreciate the educational requirements for jobs, the educational opportunities available, and the place of education in their vocational development.

(e) Otherwise to develop "planfulness" — a look ahead.

8. The school must really promote democratic thinking under democratic living. The mere fact that all kinds of children are brought together into one building means nothing unless they work together, study together, and do all these things in a spirit of understanding and desire for mutual appreciation. People of varying interests and capacities are more likely to learn to hate each other unless there is guidance, leadership, and deep humanity among principals and teachers who are responsible for them.

9. The vocational education in a comprehensive high school must be good. It

must dignify itself by its quality. The teachers must be intelligent, skillful, personable. The superintendent and principal must be ever so alert in selecting vocational teachers. We in North Carolina have retrained 104 of our present voational education and academic teachers by putting them through a rigorous special session of summer school and plan extensive in-service education throughout the year in order that they might better teach "Introduction to Vocational Education."

For the vocational education teachers who will be added in the comprehensive vocational education program, courses are available to broaden their perspective and to increase their ability as a teacher. A "practice-teaching" plan with new teachers being apprenticed to a "master teacher" is also being suggested.

10. The school must provide special opportunities within their chosen fields or vocations for gifted pupils and the slow learners. Any claim to comprehensiveness assumes that every individual will receive the education that is best for him.

11. The school must have an advisory board on vocational education that includes the best employees and employers in the community. They should be drawn from businesses and industries of the area. No comprehensive high school can be successful without the support, understanding and sympathetic cooperation of "the people who run the town."

12. The school must have a strong parents' association. Of course, many advisory board members will be parents and all male parents will be employers or employees or self-employed. So, cooperation between parents' associations and advisory boards, and cooperation of both these associations with the local Board of Education are essential to the success of the school.

13. The school shops must not become repositories ("dumping grounds" is the usual term) for rejects and discards from academic classes. At the same time, the school shops should admit all slow learners who are responsible enough and skillful

enough to benefit from shopwork.

14. The school should not restrict shopwork to pupils over sixteen or over any other age. Shopwork should be available to every youngster as soon as interest manifests itself (or can be skillfully stirred up) and responsibility and aptitude are evident.

15. The school should be open and adaptable to average pupils who for any reason have had to defer their participation in the offerings of such a school. (In North Carolina these would include only those who, for any reason, were not admissible to community colleges.)

Texts on Comprehensive Schools

While numerous approaches to the comprehensive school idea have been published during the last thirty or forty years, specific literature under that name has reached no great volume.

The first was probably Milo H. Stuart's "The Organization of a Comprehensive High School," MacMillan, 1926. Stuart was first principal of Arsenal Technical School in Indianapolis, and later became superintendent of schools in that city. This school is still an outstanding example of a comprehensive high school.

The second was the evaluation of existing comprehensive high schools in 1932 by the U. S. Office of Education:

Grayson N. Kefauver, Victor H. Noll, and C. Elwood Drake, The Horizontal Organization of Secondary Education, National Survey of Secondary Education, Monograph No. 2, U.S. Office of Education, Washington, Government Printing Office, 1934

Later books have been The Comprehensive High School, by Franklin J. Keller, Harper & Brothers, 1955, and The Comprehensive School, by Robin Pedley, Penguin Books, 1963, which gives a detailed account of the English development.

Cooperative Courses

Work experience must permeate the entire program. The vocational school is not merely a full-time day experience for high school boys and girls. It fosters part-time employment (Cooperative courses), apprenticeship courses (part-time, in cooperation with management and unions), extension courses for out-of-school youth and adults and evening courses for all who work during the day. Our schools will work in close cooperation with the community colleges, technical institutes, and industrial education centers wherever it seems desirable.

Note on the Double-Purpose High School

In a previous paragraph it was noted that the comprehensive high school should also function as a double-purpose high school, one which prepares for both occupation and college. That is to say, the pupil takes his full share of vocational preparation and also develops himself for entrance into college so that he might either take up a vocation or enter college at the end of high school. Just as there is a section of our school population gifted with verbal intelligences, our potential scholars and professionals, who seem well served by straight preparation for college and higher education, so there is a significant proportion of young citizens who have dominant talents of other kinds which they desire to develop to a skilled occupational level during secondary school years. These are as truly our gifted children as are those others of marked academic interests. Many of these, perhaps a majority, have also high IQ's. They have the ability to carry on preparation for college side by side with as great training as possible for a chosen occupation. These are not students who need to have an interest "teased" out of them. They are those who know what they want. They frequently have great capacity and eagerness for hard work. They can carry a double load of work with zest and no great strain. These are the individuals

the double-purpose high school serves par excellence. It accepts also those of marked occupational talent who know they have neither desire no capacity for college but who know beyond a doubt what they desire to do from the moment of high school graduation. For all such pupils the double-purpose high school functions.

*SCHEDULING; *FLEXIBLE SCHEDULING; *INSERVICE TEACHER EDUCATION; *VOCATIONAL EDUCATION TEACHERS
*MCBEE KEYSORT

The New York State Regional Industrial Center in New York City provided, after regular school hours, a training service for approximately 1,000 regularly employed vocational-technical teachers. Because of the special needs of a variety of teachers, scheduling and maintaining the training program called for a more flexible method for scheduling. The Keysort system designed by the McBee Corporation was chosen. With the cooperation of this company, a subject card was designed. The make up of the card, student scheduling, instructor scheduling, room assignments, and mailing of scheduling results are described. The card system was successful--scheduling time was reduced by two-thirds, total training time for some students was shortened from 4 to 6 years to 2.5 to 3.5 years, conflicts in schedules were avoided or easily adjusted, and more students were accomodated at a time agreeable to them. Scheduling Card for Voc-Tech Teachers Training Shortens Training Period

This scheduling card, sample attached, was devised in 1963 by the writer, Fred C. Finsterbach, while he was Director of the New York State Regional Industrial Teacher Training Center in New York City.

## The Situation

The Center maintained, after regular school hours, a training service for Vocational-Technical teachers from the five boroughs of New York City, Suffolk County on Long Island, and Westchester-Rockland Counties upstate. Registration at that time, counting about 200 private trade school teachers accommodated on Saturdays, ran to a total of 1,000.

Because these teachers-in-service were regularly employed and had their own professional and private obligations (often including the necessity to "moonlight" a second job), scheduling and maintaining a training program of thirty-two semester hours was a monumental task.

This task was further compounded by the many variables in a service designed to accommodate trade "shop" teachers, technical lab teachers, related subjects teachers, co-op coordinators, and teachers of practical nursing. Each of these was at various stages in their studies and some had special needs for only a limited number of credits. Moreover, and important to the students, the

long travel distances and urban traffic congestion did not help the situation. Insofar as possible, classes were offered at two other extension locations, one on Long Island and one in Westchester County, to lessen the disadvantages of travel. All of this called for a more flexible plan for scheduling. With the large numbers of students and their many variables, a "computer" approach became essential.

Lacking resources for this kind of sophisticated service, the "poor man's computer", the McBee Keysort or edge punch card, was utilized. With the cooperation of a specialist from McBee, the subject card was made up and proved to be a phenomenal success, not only in easing an otherwise ulcerous condition of scheduling, but in actually shortening the total span of time necessary for teacher training.

Makeup and operation of the card -

1.0 The key-sort card employs a needle and a "V" punch as control tools. The McBee people have devised a code for alphabetizing names. So, in the "name" section (upper right edge of card), it is possible to code any number of cards and to put them in exact alphabetical order with no more than 16 passes of the sorting needle.

1.1 The right edge of the card was used for coding the "availability of students", ascertained by a pre-scheduling "availability slip" mailed in by the students. For example, numbers one to five on the right edge of the card indicated availability for classes from 4:30

to 6:30, Monday through Friday. Six was reserved for Saturday. Numbers 7 through 11 were used to indicate availability for classes held 7:30 to 9:30. If a student indicated availability on any of these days or times, the hole at the number was punched into a "V" by a hand punch.

1.2 Similarly, the categorical entries along the left top edge of the cards were punched out for each student. Naturally, the punching had to be done accurately. The "M, BK, BX, Q, St. I, and Out-of-City" indicated the residence location of the student.

1.3 If the student was in a car pool with others, he so indicated this fact on his "availability slip" and named his companion(s). The cards for the companion(s) in the car pool were "pulled" and specially scheduled so they all could travel together. This, incidentally, was a much appreciated, humane, and necessary accommodation for adult students.

1.4 Next, the courses that were in the curriculum for the particular type of teacher were indicated by encircling the course numbers on the lower edge of the card.

Courses already completed (or credited-by-transfer) were "V" punched out of the card.

This left "courses to be taken" and the cards were then ready for scheduling.

1.5 Scheduling Planning -

The schedule was planned by extension of the following example:

The total number of cards was sorted by running the needle through the category "trade". All the "trade" teachers dropped from the needle. These were then "needled" to find out how many required psychology.

This number was temporarily recorded as a "need", if it reached or exceeded 25, the number in a class.

It was then necessary to ascertain how many of those who "needed" the course were available on a given day and time. The "need psychology" cards were then sorted by means of the right hand slots, and the number recorded by day and hour. Usually, a one day and one set of class hours consensus was revealed and this time was tentatively set aside for "psychology".

The same procedure was used to determine the "need" and "best time" for each other subject. When all the "facts" were in, the schedule was "set". The next step was to make instructor assignments.

2.0 Instructor scheduling -

In the New York Center area we were fortunate in having a large number of capable instructors available for part-time teaching. These were utilized, together with a permanent staff of three professors. Naturally,

these part-time instructors had availability preferences. So, we kept a separate card system for them and matched their specialities and time availability to those of the classes.

Our own staff of three professors, though they, too, had their own specialities, were versatile enough to be utilized in several positions. We tried, however, to include their preferences, their special abilities, and their place of residence in the total situation.

2.1 Room assignment -

The last factor in scheduling was the assignment of rooms. We had available (on a rental basis from New York University) five classrooms and one audiovisual laboratory. This gave us a total of 12 classrooms per day for scheduling. The classes that were housed in donated quarters on Long Island and sometimes upstate relieved whatever congestion we might have had.

3.0 Summary -

Altogether the card was successful in many ways:

3.01 It double checked the accuracy of our permanent records.

3.02 It improved the accuracy of our clerical personnel.

3.03 It shortened the task of scheduling by a factor of 4.

3.04 It enabled the scheduling of full-size classes with little or no overcrowding. (Sometimes a senior, in order to graduate, was accommodated as an overload in a given class.)

3.05 It shortened the total training span for some students from a four-to-six year span to one of 2.5 to 3.5 years.

3.06 Conflicts in schedules were avoided and/or easily adjusted.

3.07 More students were able to be accommodated at times agreeable to them or in line with their personal obligations.

(In the New York area, religious requirements were an added variable that had to be considered in the total program.)

3.08 Student morale was materially improved. Possibly, for the first time in their experience, an arbitrary method of scheduling gave way to one of "accommodation".

3.09 Cards from previous terms could be superimposed on new cards, thus improving the recording accuracy.

3.10 The student had a per-term and continuous record of courses he still needed, if he retained his copy of the card.

4.0 Cost factors and references -

4.01 The cards cost about ten cents each, printed as per sample with carbons attached.

4.02 The address of the Royal-McBee Corporation (they have offices in principal cities) is:

235 East 42nd Street
New York 17, New York

Mr. Edwin Carlson, District Manager

The Royal-McBee Corporation is a part of the Litton Industries.

An explanatory booklet describing the system is available free. Ask for form KSP-63-172 S-605-R63

Contributed as a service to Vocational-Technical teacher training by Dr. Fred C. Finsterbach, now Education & Training Consultant, Delaware Occupational Research Coordinating Unit, Dover, Delaware.

AGRICULTURAL LABORERS; *MIGRANT WORKERS; *STATE PROGRAMS; *FEDERAL LAWS; COMMUNITY ACTION; *DIRECTORIES; *COMMITTEES; DISADVANTAGED GROUPS; FEDERAL AID

Information about state committees concerned with migratory labor is given in this revised bulletin. Committees in 28 states assist community groups in translating federal legislation into local action programs through studying the different aspects of the migrant problem, coordinating existing programs to alleviate the problems, and making recommendations to the governors and agencies for improving programs and services. Recent federal legislation affecting agricultural workers is The Manpower Development and Training Act of 1962, The Migrant Health Act of 1962, The Economics Opportunity Act of 1964, The Farm Labor Contractor Registration Act of 1964, and The Housing Act of 1964. A list of federal agencies which have responsibility for administering laws and programs is included. For each of 34 committees in the 28 states, information is provided on the (1) type of membership, (2) establishment date and method, (3) purpose, (4) activities, (5) meeting schedule, (6) financing, (7) staff, (8) future plans, and (9) member names and representation. ## THEIR ORGANIZATION AND PROGRAMS

BULLETIN 274

June 1965

U. S. DEPARTMENT OF LABOR
W. Willard Wirtz, Secretary
BUREAU OF LABOR STANDARDS
Nelson M. Bortz, Director
Washington, D. C.

## *FOREWORD*

This publication is a revision and expansion of "State Migratory Labor Committees--Their Organization and Programs," Bulletin 215, issued by the Bureau of Labor Standards in 1960. As revised, the Bulletin contains information about a number of unofficial committees in addition to those appointed by governors or established by legislative action.

Recent Federal legislation and other developments affecting seasonal agricultural labor offer State migratory labor committees an unprecedented opportunity to help improve the living and working conditions of resident and migratory farm workers. It is hoped this report will encourage existing committees to take a new look at the evolving agricultural picture as it affects the people concerned: seasonal workers, employers, consumers, and to develop programs to meet the challenges created by the new legislation.

For ready reference, the Bulletin concludes with the names and addresses of agencies to which interested persons may write for further information on Federal laws and related programs which are cited in the Introduction. The Bureau wishes to thank the 34 reporting committees for their cooperation in making available the information for this publication.

# INTRODUCTION

For many years, church-related groups and several lay organizations have conducted programs of service to agricultural workers, particularly the domestic migrant and his family. The growing public awareness and sense of responsibility which have developed in recent years for this disadvantaged segment of our population are largely a result of the work of these pioneering groups. With the incentives now offered by the availability of Federal funds, community groups are motivated now more than ever before to conduct action programs with and on behalf of agricultural workers.

Unlike the urban centers, many rural areas do not have the ready-made leadership for initiating needed programs.

In assisting these community groups in their organization, plans, and programs, the State committee is offered a unique opportunity to translate Federal legislation into ongoing programs to improve the living and working conditions of all our agricultural workers. Committees can develop their own programs geared to the particular needs of their locality and prove them in terms of human lives. The challenge, then, to State committees is to assist these working poor and their families to become self-sufficient, responsible members of our society, whether they continue in agricultural work or change to some other kind of employment.

## A Look at Existing Committees

Twenty-eight States have reported a total of 34 committees--with six States having two each. The States are:

| | |
|---|---|
| Arizona | New Jersey |
| Arkansas | *New York |
| California | North Carolina |
| Connecticut | North Dakota |
| Delaware | Ohio |
| *Florida | Oregon |
| Idaho | *Pennsylvania |
| Illinois | South Carolina |
| *Indiana | Tennessee |
| Maryland | Texas |
| Massachusetts | Virginia |
| *Michigan | *Washington |
| Minnesota | West Virginia |
| Nebraska | Wisconsin |

* Indicates States having two committees.

Of the 34 committees, eight are composed of public agency representatives only; eight of nongovernmental personnel only; and the remaining 18 of both governmental officials and private citizens. The latter may represent church organizations, civic groups, labor unions, private agencies, or other interested groups.

Twenty-one of the 34 committees were appointed by governors; three by legislative action, and the remaining 10 through the voluntary effort of agencies, organizations, or private citizens concerned. Nineteen of the 34 committees were first established during the period 1955-60; eleven since 1960; two between 1950 and 55; and two in the 1940's. The majority of the committees appointed by governors were reappointed by succeeding governors as administrations changed.

The expressed purposes of committees vary somewhat and are reflected in the activities of each. The majority have the general aim of studying the different aspects of the migrant problem; coordinating existing programs to alleviate the problems; and making recommendations to the governors, the constituent agencies, and others for improvement of programs and services. A few were established for more specific purposes such as inspecting housing, drafting housing and sanitation codes, developing and administering projects in cooperation with the Office of Economic Opportunity, supporting certain Federal legislation, or obtaining "equal rights" for agricultural workers. Several committees are advisory only, either to one agency or to the official interdepartmental committee. One or two confine their activities to studies and recommendations on the basis of findings.

The earlier committees were usually restricted in membership to representatives of public agencies concerned. Since 1960, the trend has been toward an expansion of membership of these official committees to include employer, church, and citizen representation. Church-related committees, on the other hand, are expanding to include representatives of public and private agencies. The Arizona Governor's Committee, formed in 1965, is unique in its composition of representatives of employers, employees, and the public. This broadening of membership reflects the growing realization that the problems of this disadvantaged group are the responsibility of all segments of the population.

The majority of the committees hold meetings on an "on call" basis. Nine meet at regular intervals; such as once a month, twice a year, or at intervals timed to the growing season. Some meet both at specified times and on call.

About half the committees indicate they have no means financing. Others reported the constituent agencies share the expenses incurred for travel, mailings, and clerical work. A few are supported by government appropriation, and a few by private contributions.

Recent Federal Legislation Affecting Agricultural Workers

State committees for migrant and other seasonally employed agricultural workers can serve as a channel of communication to local groups in helping them to understand the new Federal legislation and to apply for and obtain the assistance now available. The committees can also be effective in translating local needs into effective government action. Recent legislation affecting agricultural workers includes the following:

A. The Manpower Development and Training Act of 1962

Under this Act, seasonal farm workers may be trained for other jobs, either in agriculture or in nonagricultural employment. If necessary, they may receive basic education prior to the training.

B. The Migrant Health Act of 1962

Under this Act, the Public Health Service is authorized to make grants to public agencies and to nonprofit State and local organizations to bring improved health services and health conditions to migrant farm families with special emphasis on family health service clinics.

C. The Economic Opportunity Act of 1964

Under Community Action Programs (Title II - Part A of the Act) and Programs to Combat Poverty in Rural Areas (Title III - Part B of the Act), Federal assistance is authorized to provide stimulation and incentive for urban and rural committees to mobilize their resources to combat poverty through community action programs. Under Title II - Part A, the seasonal agricultural worker is included in overall poverty-related community programs; and under Title III - Part B, in the specified areas of housing, sanitation, education, and day care for children.

D. The Farm Labor Contractor Registration Act of 1964

This Act requires that farm labor contractors register with the Secretary of Labor if they contract with 10 or more workers for interstate agricultural employment. The aim of

The Act is to improve conditions for interstate migrant agricultural workers by requiring that farm labor contractors and crew leaders observe certain rules in dealing with their crew members.

E. The Housing Act of 1964

Under authority of this Act, low-rent housing for migrants and other domestic farm laborers can be built with the assistance of Federal grants not exceeding two-thirds of the development cost. As of May 1965, no funds had been made available to implement this legislation.

## NAMES AND ADDRESSES OF CERTAIN FEDERAL AGENCIES

The Federal agencies listed below, located in Washington, D. C., have full or partial responsibility for administration of laws and programs cited in the Introduction. Interested persons may write to the addresses given for general information regarding the respective subjects:

1. Improving the living and working conditions of migrant and other seasonal agricultural workers

   U. S. Department of Labor
   Bureau of Labor Standards
   Division of State Services and Standards

2. Job training, experimental and demonstration projects, and job development

   U. S. Department of Labor
   Manpower Administration
   Office of Manpower, Automation and Training

3. Grants for migrant health projects

   U. S. Department of Health,
   Education, and Welfare
   Public Health Service
   Bureau of State Services

4. Assistance with community action programs and with projects for housing, sanitation facilities, education, and day care

   Office of Economic Opportunity
   Special Field Projects
   Migrant Branch

5. Recruitment of farm labor
   and
   Registration of farm labor contractors or crew leaders

   U. S. Department of Labor
   Manpower Administration
   Bureau of Employment Security
   Office of Farm Labor Service

6. Rural housing programs and financial assistance to provide low-rent housing for domestic farm workers

   U. S. Department of Agriculture
   Farmers Home Administration

## Governor's Committee on Seasonal Farm Labor

### Type of Membership

Nongovernmental.

### How Established and When

Appointed by governor, April 1965.

### Purpose for Which Committee Was Established

To inquire, from the points of view of all interests concerned, into conditions of migrant labor and its effect on the State's social and economic well-being; and on public education, health and welfare, employment, farm production, law enforcement, the tax burden, and other matters.

To advise and assist the governor in the development of a long-range program to enhance the contribution of the migrant worker to the State and to help the migrant worker help himself to further his own well-being.

To recommend programs designed to bring about a greater awareness on the part of the public in understanding the problems of migrant workers and to enable the public to recognize the part which can be played by public and voluntary agencies concerning migrant workers.

To coordinate anti-poverty programs relating to migrant and seasonal farm workers in the State.

### Description of Activities

This is a new committee--no activity to date.

### Committee Meetings

Regularly scheduled (monthly).

### Method of Financing

No financing required.

### Paid Staff, If Any

None.

### Future Action Plans

Committee is expected to encourage full utilization of resources available under Economic Opportunity Act.

Committee Members' Names and Representation

Employees' Representatives

Reverend Armando Sierra
El Mirage, Arizona

Reverend Harold Lundgren
Phoenix, Arizona

Reverend Fidelis Kuban

## ARKANSAS

### Governor's Committee on Migratory Labor

Type of Membership

Governmental and nongovernmental.

How Established and When

Appointed by governor, May 18, 1962.

Purpose for Which Committee Was Established

To deal with problems of migrant farm workers in the State of Arkansas in the areas of community acceptance, day care, education, health and housing, recreation, welfare, transportation, working conditions and needed protective labor legislation.

Description of Activities

This committee is advisory in nature.

Committee Meetings

On call.

Method of Financing

None.

Paid Staff, If Any

None.

Future Action Plans

None at this time.

## CALIFORNIA

### Citizens for Farm Labor

Type of Membership

Nongovernmental.

How Established and When

Formed in October 1963 by interested Californians. Is now incorporated as a nonprofit organization under California State law.

Purpose for Which Committee Was Established

To obtain equal rights for agricultural workers through public education, legal and political action, and community organization.

Description of Activities

1. Legislation supported:

   a. Unemployment insurance.
   b. Collective bargaining machinery.
   c. Fair Labor Standards Act Amendments.
   d. Removal of agricultural exclusion from Fair Employment Practices Act.
   e. Agricultural coverage under State Health and Safety Code.

2. Studies made:

   See item 3.

3. Reports and publications issued:

   "Farm Labor" on an irregular basis.

   Books:

   "Fields of Bondage" ($1.50 per copy).
   "Harvest of Loneliness" ($3.95 per copy).
   (Available from Berkeley address).

4. Assistance to local committees on migratory labor, local public or private agencies, or other organizations:

Work in cooperation with:

Emergency Committee to Aid Farm Workers.
Friends Committee on Legislation.
Migrant Ministry.
Farm Workers Association, Delano, California.
Mexican-American Political Association.
Other church, labor, and civil rights organizations.

5. Other:

Members present testimony at administrative and legislative hearings and are available for speaking engagements to interested groups.

Committee Meetings

Two regularly scheduled meetings are held, a monthly membership meeting and a monthly executive meeting which takes place between the membership meetings.

Method of Financing

Magazine subscriptions and voluntary contributions.

(The cost of the magazine is $3 for twelve issues to nonmembers. Membership dues are $5, which includes the magazine subscription and other prerogatives.)

Paid Staff, If Any

None.

Future Action Plans

To continue public education through their magazine and other activities.

### Governor's Committee on Migratory Labor

Type of Membership

Governmental and nongovernmental.

How Established and When

Appointed by governor, 1955.

Purpose for Which Committee Was Established

To exchange information, initiate action, sponsor legislation, keep governor advised, coordinate work with other States and Federal agencies.

Description of Activities

1. Legislation supported:

   Registration of Crew Leaders--not needed now in view of Federal Act.

   Housing regulations of State Board of Health.

2. Studies made:

   Minutes of meetings which include reporting of agencies concerned.

Committee Meetings

Preseason, postseason, and on call.

Method of Financing

None--each member agency pays expense of representative, if any involved.

Paid Staff, If Any

None.

Future Action Plans

Working closely with Department of Health, Education, and Welfare to develop programs in health, education and day care. Also with Office of Economic Opportunity State coordinator in planning programs under Title III-B of Economic Opportunity Act.

### Governor's Inter-Agency Committee on Migrant Agricultural Labor

Type of Membership

Interdepartmental.

How Established and When

By action of the governor in 1958.

Purpose for Which Committee Was Established

To consult on means to improve health, education, welfare, housing and transportation of migrants, and to sponsor legislation as needed.

Description of Activities

1. Legislation supported:

   Regulation of transportation, labor camp regulation. Latter has been enacted.

2. Studies made:

   Housing study made prior to enactment. Recommended plans and estimated costs of migrant housing. Made them available to growers.

3. Reports and publications issued:

Migrant Labor Camp Housing Plans.

4. Assistance to local committees on migratory labor, local public or private agencies, or other organizations:

The Committee is subject to call for emergencies. Secretary of the Committee has supplied all local committees on migratory labor with copies of the Economic Opportunity Act and specified whom to contact for further information in program planning.

Committee Meetings

On call.

Method of Financing

Each agency bears cost of its representative on Committee.

Paid Staff, If Any

None.

Future Action Plans

New governor has not yet reappointed the Committee.

Committee Members' Names and Representation

This Committee was reappointed in 1962 by Governor Bryant and as yet the new Governor, Haydon Burns, has not announced his appointments to this Committee.

## Florida Citizens Committee on Agricultural Labor

### Type of Membership

Nongovernmental.

### How Established and When

By stimulation of National Advisory Committee on Farm Labor in 1964.

Purpose for Which Committee Was Established

Advocacy of the workers case, via legislation, coordination and stimulation of services via conference education.

Description of Activities

Committee is in its first year of operation and it is in the process of setting its goals.

Committee Meetings

Yearly, in the spring. Executive Committee on call.

Method of Financing

Donations from members.

Paid Staff, If Any

None. Some guidance from National Advisory Committee on Farm Labor.

Future Action Plans

State legislation is sought - probably regarding transportation, safety and health care.

Committee Members' Names and Representation

President: Dr. J. C. Ross
President, University of
Southern Florida
Tampa, Florida

Vice President: Cordie Pearson
18249 S. Dixie Highway
Perrine, Florida

Treasurer: William Allen
Box 7097
Tampa, Florida

Secretary: Mrs. James O. Bond
1705 N. Oregon Circle
Tampa, Florida

Thirty or forty members on the Committee

## IDAHO

The Governor's Migratory Labor Committee

Type of Membership

Interdepartmental.

How Established and When

Appointed by governor in 1955.

Purpose for Which Committee Was Established

To promote improvements in housing, sanitation and general welfare of the migrant worker in Idaho.

Description of Activities

1. Legislation supported:

   The committee makes recommendations to the legislature or to the proper department.

2. Studies made:

   Each year a study is made of labor camps.

3. Reports and publications issued:

   Annual Reports on Idaho Migratory Labor Camps.

4. Assistance to local committees on migratory labor, local public or private agencies, or other organizations:

   Service is given to the Oregon-South Idaho Council of Churches.

Committee Meetings

On call.

Method of Financing

Financing is shared by each agency represented.

Paid Staff, If Any

None.

Future Action Plans

None at the present time.

## ILLINOIS

### Committee on Agricultural Migrants and Their Families, Commission on Children

#### Type of Membership

Governmental and nongovernmental.

#### How Established and When

Authorized by the governor and appointed by chairman of Commission on Children, 1955.

#### Purpose for Which Committee Was Established

Fact finding, dissemination of information, public education and stimulation of existing organizations and departments on behalf of the migrant worker and his family.

#### Description of Activities

1. Legislation supported:

   . Licensing of agricultural migrant camps; State reimbursement to local school districts for summer programs for all children, including migrant children; inclusion of migrant children in compensatory education programs; all Federal legislation except the "pooled labor bill."

2. Studies made (in last 2 years):

   Coverage of migrants by workmen's compensation and insurance programs in other States.

   Current pattern of migrant workers in Illinois (first study made in July 1958). This study was made in July 1964 to note changes in numbers and location.

   Type of guidelines needed by local school districts in setting up programs for migrant children.

   Problems and bottlenecks in our current migrant camp licensing act and changes needed to make it more effective.

3. Reports and publications issued:

Programs for Agricultural Migrant Workers and Their Families.

Map of location and numbers of migrant workers by county and crops in which they work (1964).

Guide on Education of Children of Agricultural Migrant Workers - a joint project and publication with the Office of Superintendent of Public Instruction.

4. Assistance to local committees:

This has mainly been in the dissemination of information through meetings, speeches, newsletters and consultation on organization and social action.

5. Other:

Provided legislative information service on numbers and content of bills, committee activity, hearings, etc.

Considered a proposal for migrant health grant; endorsed it and supplied collateral information to substantiate it.

Committee Meetings

On call--three held last year.

Method of Financing

It is a part of the responsibility of the Commission, which has a biennial appropriation from the Legislature. Special projects or publications are frequently supported by grants. Members of committee finance their own committee meeting expenses.

Paid Staff, If Any

The Executive Director of the Commission serves as the staff of the Committee on Agricultural Migrants and Their Families, and the clerical staff of the Commission performs such clerical duties as required.

Future Action Plans

Improvement of the migrant camp licensing act.

The recent publication, "Guide on Education of Children of Agricultural Migrant Workers," is to be presented to school officials in a series of meetings.

Women's and Children's Division
Illinois Department of Labor

## INDIANA

### Governor's Committee on Migratory Labor

**Type of Membership**

Governmental and nongovernmental.

**How Established and When**

Appointed by the governor in January 1960.

**Purpose for Which Committee Was Established**

To study migratory farm labor problems, coordinate activities of various groups and make recommendations to individuals, employers and governmental agencies.

**Description of Activities**

Instigated and actively assisted in the establishment of minimum standards for housing and an inspection program by the State Board of Health. This in turn led to legislation requiring mandatory inspection of migrant camps which will be effective in 1966.

Supported legislation for State funds for a migrant rest stop and information station but legislation was not enacted.

The Progress Report of the Governor's Committee on Migratory Labor 1960-1963, published in 1964, gives a rather complete picture of the Committee's activities during its first four years. During 1964 the Committee continued its operations much the same as in 1963.

The Committee has served as a coordinator and has provided a forum for all interested in the migrant labor problems.

## Committee Meetings

Meetings are held on the first Monday of each month.

## Method of Financing

No financing is available. Each member has paid his own expenses incurred in serving on the committee. Secretarial work, production and distribution of materials has been provided by the Indiana Employment Security Division.

## Paid Staff, If Any

None.

## Future Action Plans

Committee expects to cooperate with and assist where possible the recently incorporated Associated Migrant Opportunity Services, Incorporated. AMOS was formed to provide a vehicle for securing funds, to be used in various activities for migrants, under the Economic Opportunity Act.

## Committee Members' Names and Representation

Chairman: Reverend W. J. Briggs, D. D.

## Michigan Citizens Council on Agricultural Labor

### Type of Membership

Nongovernmental.

## How Established and When

Established in 1961 by a group of interested citizens, including growers, farm organizations, State department officials, religious groups, social workers and lay citizens.

## Purpose for Which Committee Was Established

To provide a common meeting place for those organizations with a genuine interest in the agricultural labor situation.

To provide a means of coordinating the efforts of organizations interested in the problems of agricultural labor.

To stimulate fact-finding or research on a broad basis concerning the factors involved in the employment and utilization of agricultural labor.

To disseminate through media, information and conclusions resulting from the efforts mentioned above or any other pertinent information on the agricultural labor situation.

## Description of Activities

1. Legislation supported:

   Summer school classes for children of migrants.

2. Studies made:

   See item 3.

3. Reports and publications issued:

   a. Survey of Services Available to Migrant Workers in Michigan by State Departments of Government.

   b. Fact-Finding Survey on Health Problems of Agricultural Workers in Michigan.

   c. Perspective on Michigan's Farm Labor Problems.

4. Assistance to local committees on migratory labor, local public or private agencies, or other organizations:

   Information provided to agencies and organizations concerned with some aspect of problem.

## Committee Meetings

On call of the Chairman.

## Method of Financing

Yearly dues.

Paid Staff, If Any

None.

# MINNESOTA

## Governor's Farm and Migratory Labor Advisory Committee

### Type of Membership

Governmental and nongovernmental.

### How Established and When

Appointed by governor, about 1954.

### Purpose for Which Committee Was Established

To give counsel and information to the Commissioner and staff of the Minnesota Department of Employment Security in matters pertaining to the recruitment and employment of agricultural workers. In addition, the Committee also concerns itself with all problems of the migrant agricultural worker and his family, including those not directly related to employment.

### Description of Activities

1. Legislation supported:

   None.

2. Studies made:

   Subcommittee presently studying and re-evaluating the Minnesota Housing Code and assisting the Minnesota Department of Health in the preparation of an interpretative fact sheet which will provide migrant labor users with a better understanding of the housing regulations.

3. Reports and publications issued:

   a. Committee meeting reports.

   b. Subcommittee report on re-evaluation of Minnesota Housing Code.

4. Assistance to local committees on migratory labor, local public or private agencies, or other organizations:

   Chairman of the committee provided the Owatonna community with information on the organization of a day center for the care and supervision of migrant children; advised New Ulm groups concerning a summer school project for migrant children; participated in local discussions on medical care for migrant workers in the Red River Valley.

Other committee members encouraged and assisted State agencies, local groups and individuals in their regular programs for migratory workers and families.

5. Other activities:

   a. Assisted in developing the program for notifying school districts of the arrival of school-age migrant children.

   b. Endorsed the agri-business multi-occupational training project under the Manpower Development and Training Act for the training and retraining of agricultural workers.

Committee Meetings

On call.

Method of Financing

Funds for necessary correspondence and mileage for members attending meetings are provided from Employment Service funds.

Paid Staff, If Any

None.

Future Action Plans

Recommend action be taken by the State Legislature in amending the residence laws "so as to make it possible for migrant workers and their families to obtain temporary welfare aid when it is needed."

Encourage and assist local groups in exploring and developing programs of assistance to migrant workers and their families as provided under the Economic Opportunity Act.

## NORTH CAROLINA

### Committee on Ministry to Migrants

**Type of Membership**

Governmental and nongovernmental.

**How Established and When**

By Council of Churches, April 1965.

**Purpose for Which Committee Was Established**

To develop project plans for submission to Office of Economic Opportunity and to administer projects when funded.

**Description of Activities**

The committee, formed out of the large, State-wide committee of the Council of Churches, which has served migrants for many years, is too new to define its activities as yet. Federal funds in the amount of $274,000 have been authorized by the Office of Economic Opportunity--to include 8 areas in various parts of the State.

The committee will assist local groups in the areas where the projects are conducted. Program content will consist largely of education; both school age and adult, child day care and improvement in housing and sanitation.

**Committee Meetings**

On call and very frequently during initial planning period.

**Method of Financing**

The Office of Economic Opportunity will reimburse the State Education Office and the Welfare Department on a contract basis for educational and day care aspects of the projects. The member agencies will pay for the travel and time of their representatives on the committee. The State Council of Churches will continue in its capacity as the overall responsible organization.

Paid Staff, If Any

The Office of Economic Opportunity will provide salaries for a project director, a housing specialist, a bookkeeper and other staff.

Committee Members' Names and Representation

Chairman: Dr. Charles Kirby
Morehead City, North Carolina

Thomas D. Adams
State Employment Service

Jack Mansfield
North Carolina Fund

Dr. Miles Hunter
Office of Education

Dr. Samuel S. Wylie
Executive Director
Council of Churches

Dr. W. Byrnes Jones
Department of Public Health

Mrs. Betty Gibson
Department of Public Welfare

Robert H. Ward
Farm Home Administration

## NORTH DAKOTA

### Governor's Committee on Migratory Farm Labor

Type of Membership

Governmental and nongovernmental.

How Established and When

Appointed by governor, 1958.

Purpose for Which Committee Was Established

To foster improvements pertaining to migrants' health, sanitation, and housing; public welfare; education; employment and transportation; community services and legislation during their stay in North Dakota.

Description of Activities

Legislation supported:

Farm Labor Contractor Registration Act.
Proposals to establish a National Advisory Council for migrant affairs.

Committee Meetings

On call, in April and October.

Method of Financing

Expenses of attendance at meetings and services of secretary paid by State Department of Employment Security.

Paid Staff, If Any

None.

Future Action Plans

Considering application for a grant under Migrant Health Act and Economic Opportunity Act.

Committee Members' Names and Representation

Chairman: Senator Grant Trenbeath
Grower and Legislator
Neche, North Dakota

Secretary: Carl M. Radloff

Association
Fargo, North Dakota

Fred Onefray
District Director
Upper Missouri Health Unit
Williston, North Dakota

Mrs. Elmer Montgomery
Manvel, North Dakota

# OHIO

## The Governor's Committee on Migrant Labor

### Type of Membership

Governmental and nongovernmental.

### How Established and When

Appointed by governor, March 25, 1956.

### Purpose for Which Committee Was Established

To assist migrants and those with whom they are associated in solving problems and to guide the existing agencies of Ohio in the use of their resources to place the migrant family as nearly as possible in the position of the resident family. To coordinate government agency efforts on behalf of the migrants, with the efforts of growers and processors, church, civic, and consumer groups as well as farm and labor organizations.

### Description of Activities

1. Legislation supported:

   State laws to provide education for migrant children while in the State. Since 1959, each General Assembly has appropriated money for the education of the children and the reimbursement of local school districts.

   Resolution asking the Legislative Service Commission to study all facets of migratory labor and recommend legislation. The resolution was adopted and the study made.

   The high cost of commercial truck licenses was reduced by passing a law setting the minimum license for "farm trucks" at $10.

   Proposal now pending which would reduce to $20 the fee for a 100-day license for a truck used to transport unprocessed agricultural products within the State.

   Rest stop regulations.

2. Studies made:

Continuing study on "Meeting the Educational Needs of the School-Age Children of Migrant Farm Workers in Ohio."

"A Study of Overnight Rest Camps for Migratory Workers in Ohio" - May 1960.

3. Reports and publications issued:

"Migratory Labor in Ohio" - the annual report of the Governor's Committee.

4. Assistance to local committees on migratory labor, local public or private agencies, or other organizations:

Continuous advisory services to local committees on migrant labor and to local agencies regarding development of community action programs.

Committee Meetings

Regularly scheduled in the spring and fall. Subcommittees meet on call.

Method of Financing

Department of Industrial Relations and other constituent agencies provide clerical assistance. There is no appropriation.

Paid Staff, If Any

None.

Future Action Plans

Project proposals emphasizing education and rest stop facilities now under consideration by Office of Economic Opportunity.

## OREGON

### Interagency Committee on Migratory Labor

Type of Membership

Interdepartmental.

How Established and When

Legislative action, 1959.

Purpose for Which Committee Was Established

To coordinate the activities of State agencies engaged in the field of Migratory Labor.

Description of Activities

1. Studies made:

   Studies are made by the individual agency on the particular aspects of the migratory labor situation with which it is concerned.

2. Reports and publications issued:

   Annual report.

3. Assistance to local committees on migratory labor, local public or private agencies, or other organizations:

   Assistance is given by the individual members but not by the Committee itself. Each agency contributes to its own phase of interest, such as the State Health Officer cooperates with the County Health Officer to maintain proper health conditions in the county in the labor camps; the Office of Public Instruction cooperates with the local schools to provide education service to the migrant children; Employment Service is

very active in recruitment and distribution of the workers; Motor Vehicle Department checks and licenses the buses for transportation of the workers; Bureau of Labor checks on conditions within the labor camps and also on the rate of pay; Industrial Insurance Commission checks for accident prevention on the farms.

Committee Meetings

Every three months and on call.

Method of Financing

Each agency pays its portion of the Committee's expenses.

Paid Staff, If Any

None, each person is paid by the agency where he is employed.

Future Action Plans

To continue study of developments and make plans based on findings.

To invite legislators, ministers and others concerned with migrants to attend committee meetings.

Committee Members' Names and Representation

Chairman: James F. Short
Department of Agriculture
Salem, Oregon

Secretary: J. D. Wilson
State Employment Service
Salem, Oregon

William Callahan
State Industrial Accident Commission
Salem, Oregon

Vern Hill
Department of Motor Vehicle
Salem, Oregon

Leon P. Minear
Department of Education

Salem, Oregon

David Cameron
Oregon State Employment Commission
Salem, Oregon

Richard Wilcox
State Health Department
Salem, Oregon

# PENNSYLVANIA

## Governor's Committee on Migratory Labor

### Type of Membership

Governmental and nongovernmental.

### How Established and When

Appointed by governor, December 1952.

### Purpose for Which Committee Was Established

To assure that migrant farm labor is brought to, maintained, and employed in Pennsylvania under conditions meeting satisfactory standards of housing, sanitation, health, and welfare. As this is the responsibility of many State departments, the committee is devoted to promoting the participation and coordination of member departments at the State and community level.

### Description of Activities

1. Legislation supported:

   State crew leader registration act.
   State camp housing and sanitation code.
   State transportation regulations.

2. Studies made:

   Studies leading to support of above legislation by the committee carried out by the appropriate agencies represented on the committee.

3. Reports and publications issued:

   Annual or biennial reports.
   Minutes of meetings.

4. Assistance to local committees on migratory labor, local public or private agencies, or other organizations:

   Obtained surplus food for migrants and arranged for its distribution.
   Conducts camp awards program.
   Acts as coordinator of services through representation on committee of agencies, management, labor, church and citizen groups.

### Committee Meetings

Regularly scheduled--preseason, during season, postseason, and on call.

Method of Financing

No budget. Committee members serve without compensation. Staff services are provided mainly by the Department of Labor and Industry. Other State agencies provide staff services in connection with individual programs with which they are directly concerned (e.g., the Department of Public Welfare provides staff services for the migrant child-care program).

Paid Staff, If Any

None.

Future Action Plans

Committee will continue support of projects under Migrant Health Act and operation of day-care centers, financed by Federal funds through the State Department of Public Welfare. Several programs, with emphasis on adult and school-age education, are being developed in cooperation with Office of Economic Opportunity.

Committee Members' Names and Representation

Chairman: William P. Young
Department of Labor and Industry
Harrisburg, Pennsylvania

Executive Secretary: James O. Hawkins

Charles L. Wilbar, Jr.
Secretary, Department of Health

Dr. George Hoffman
Acting Superintendent
Department of Public Instruction

Bureau of Employment Security

Rev. Anthony F. Kane
Director, Catholic Apostolate for Migrants

Rev. J. H. Haggler, Jr.
National Association for the Advancement of Colored People

Mrs. E. S. Smith, President
Pennsylvania Congress of Parents and Teachers

Mrs. Isaac Lehmer
Representative, Pennsylvania
Federation of Women's Clubs

Clair Winand
Elbert Damon, Executive
Director, Pennsylvania
Canners Association

J. Carl Empie, Member, Board
of Directors, Pennsylvania
Farmers Association

Paul Rowe, Immediate Past
President, Pennsylvania
Vegetable Growers
Association

A. David Bouterse
Executive Secretary
Pennsylvania Citizens Council

Robert Jones, Vice President
Pennsylvania Cooperative
Potato Growers

William H. Lott, Immediate
Past President
Pennsylvania Horticulture
Association

John W. Scott, Master
Pennsylvania State Grange

Joseph M. Walsh
Representative
Pennsylvania AFL-CIO

## Pennsylvania Citizens Committee on Migrant Labor

### Type of Membership

Nongovernmental.

### How Established and When

By action of citizens meeting at Bucknell University, May 17, 1952.

### Purpose for Which Committee Was Established

To improve conditions of housing and labor of migrant farm workers in Pennsylvania.

### Description of Activities

1. Legislation supported:

   Migrant legislation introduced by Senator Harrison Williams.

   Opposed extension of PL 78.

2. Studies made:

   Periodic surveys of migrant conditions.

3. Reports and publications issued:

Sweden's Farm Day Nurseries--1958.
Agricultural Seasonal Laborers in Colorado and California--1962.
Can We Afford Nurseries? (In Journal of Nursery Education--January 1964), Cyrus H. Karraker.

4. Assistance to local committees on migratory labor, local public or private agencies, or other organizations:

Furnished information on condition of migrants to Governor's Committee on Migratory Labor.

5. Other:

Supported the use of Children's Bureau funds by the State Department of Public Welfare to establish day-care centers.

Reports on housing led to better housing regulations.

Publicity on conditions through speeches, articles, etc.

Committee Meetings

On call.

Method of Financing

Contributions.

Paid Staff, If Any

None.

Future Action Plans

President and Executive Secretary are serving as volunteer recruiters for Job Corps. Expect to serve as consultants regarding migrant children.

Committee Members' Names and Representation

President: Dr. Cyrus H. Karraker
1137 Market Street
Lewisburg, Pennsylvania

Executive Secretary: Mrs. Lois Garvin
50 Brown Street
Lewisburg, Pennsylvania

Membership not given

# SOUTH CAROLINA

## South Carolina Committee for Development and Improvement of Migratory Workers

### Type of Membership

Interdepartmental.

### How Established and When

Formed by Rural Industries Supervisor of State Employment Service in 1954.

### Purpose for Which Committee Was Established

To study conditions of migrants; develop and coordinate agency programs for improvement of housing, employment, health and other aspects of their situation.

### Description of Activities

Works with employers and crew leaders and migrants to improve housing and sanitation. Provides information and guidance to church groups in their programs for migrants.

### Committee Meetings

On call.

### Method of Financing

None.

### Paid Staff, If Any

None.

# TEXAS

## Texas Council on Migrant Labor

### Type of Membership

Interdepartmental.

### How Established and When

Legislative action, 1957.

### Purpose for Which Committee Was Established

To coordinate the work of several State governmental agencies; to improve travel and living conditions of migrant agricultural workers in the State of Texas.

### Description of Activities

1. Legislation supported:

   Texas law prohibits active support.

2. Studies made:

   Studies are made in the areas of health and welfare, education, interstate travel, crew leaders and housing. (home base housing and labor camp housing)

3. Reports and publications issued:

   An annual report covering statistics on the movement of migrants--by State and County, mechanization and its effect on the migrants, trends of total migration, education, housing, and other problem areas of the Texas migrant labor group. This report has been issued since 1958.

4. Assistance to local committees on migratory labor, local public or private agencies, or other organizations:

   The Council has worked closely with the Texas Committee on Migrant Farm Workers.

### Committee Meetings

On call.

### Method of Financing

Legislative appropriation, which is included in the governor's budget.

Paid Staff, If Any

Executive Director and a clerk-stenographer.

Future Action Plans

Council to become a Division of the Texas Good-Neighbor Commission in September 1965. This action will unite future action of Council with that of citizen organization.

## Subcommittee on Migratory Labor of Governor's Interagency Committee on Health, Education and Welfare

### Type of Membership

Interdepartmental.

### How Established and When

Appointed by governor, 1959.

### Purpose for Which Committee Was Established

Originally formed to draw up health code; later to advise the governor on policies that affect the migrant labor.

### Description of Activities

1. Studies made:

   During 1964 completed a study on day-care needs in two areas of the State.

2. Reports and publications issued:

   Day-care Needs in Yakima and Puyallup Sumner Areas.

3. Assistance to local committees on migratory labor, local public or private agencies, or other organizations:

   Rendered assistance to the Walla Walla Migrant Council to help them file application for grant under the Economic Opportunity Act.

   Jointly sponsored the Conference held November 13, 1964, in Yakima, Washington, on "People Who Harvest Our Crops."

4. Other:

   Negotiated with Washington State University requesting they draw up a study design on the needs of migrants; now under preparation.

### Committee Meetings

On call.

### Method of Financing

Helped by the Washington Citizens for Migrant Affairs Committee.

Paid Staff, If Any

None.

Future Action Plans

Indefinite.

Committee Members' Names and Representation

Chairman: Maurice Powers
Department of Public Assistance
Olympia, Washington

Jack Matthews
Department of Health
Smith Tower
Seattle, Washington

Howard Magnuson
Department of Instruction
Olympia, Washington

Olympia, Washington

## Citizens Advisory Committee on Migratory Labor

Type of Membership

Nongovernmental.

How Established and When

Appointed by governor, 1962.

Purpose for Which Committee Was Established

To advise the Subcommittee on Migratory Labor of the Governor's Interagency Committee on Health, Education, and Welfare regarding needed State and federal action, including legislation, and to assist in developing a single point of view regarding the State's responsibilities to migrants.

Description of Activities

1. Legislation supported:

   Removal of agricultural exemptions from State labor laws.

2. Studies made:

Problems affecting migrant labor.

3. Reports and publications issued:

---

4. Assistance to local committees on migratory labor, local public or private agencies, or other organizations:

Advises local organizations on their programs for migrants. Holds meetings in different parts of State.

Committee Meetings

On call--about four times a year.

Method of Financing

Voluntary contributions.

Paid Staff, If Any

None.

Future Action Plans

In cooperation with State Office of Economic Opportunity officials, study the need for programs with Office of Economic Opportunity financial assistance.

## WEST VIRGINIA

### Governor's Interdepartmental Committee on Migratory Labor

Type of Membership

Interdepartmental.

How Established and When

Appointed by governor, 1959.

Purpose for Which Committee Was Established

To study the living and working conditions of migratory labor in West Virginia and coordinate the activities of the State departments concerned with these problems, and to encourage them to develop other needed programs, including satisfactory standards for housing, sanitation, health, transportation, schooling, workmen's compensation, unemployment compensation, and welfare services.

Description of Activities

Coordination of State activities. Improvement in migrant education, transportation and housing stressed.

Committee Meetings

On call, by chairman.

Method of Financing

Each agency finances its representative on the committee.

Paid Staff, If Any

None.

Future Action Plans

Under consideration.

Committee Members' Names and Representation

Chairman: Clement R. Bassett
Commissioner, Department of Employment Security

Secretary: John O. Crawford
State Clearance Supervisor
Department of Employment Security

Lawrence Barker, Commissioner
Department of Labor

Dr. N. H. Dyer, Director
State Department of Health

John T. Johnson, Commissioner
Department of Agriculture

Rex M. Smith
State Superintendent of Schools

Col. William E. Burchett
Superintendent, Department of Public Safety

Cletus B. Hanley, Director
Workmen's Compensation Fund

W. Bernard Smith, Director
Department of Welfare

## WISCONSIN

Governor's Committee on Migratory Labor

Type of Membership

Governmental and nongovernmental.

How Established and When

Appointed by governor, June 1960.

Purpose for Which Committee Was Established

To gather and distribute information on migratory labor, to promote programs to meet special needs with the help of the Migrant Health Act and Economic Opportunity Act, and to recommend legislation.

Description of Activities

1. Legislation supported:

   Bill to strengthen Migrant Camp Law.
   Bill on emergency medical aid for nonresidents.

2. Studies made:

   Waushara County Migrant Survey, summer 1964 (to be published).

3. Reports and publications issued:

   Report to the Governor on committee activities, April 1964.

4. Assistance to local committees on migratory labor, local public or private agencies, or other organizations:

   Cooperates with local committees and church groups and school administrators in promoting Economic Opportunity Programs.

Committee Meetings

Semiannual.

Method of Financing

None.

Paid Staff, If Any

Received grant for one part-time staff member from State Economic Opportunity Office.

Future Action Plans

Plan to continue to promote projects through Economic Opportunity Act and Migrant Health Act.

Committee Members' Names and Representation

Chairman: Elizabeth Brandeis Raushenbush

State Plan for Workshops and Rehabilitation Facilties.

Missouri State Dept. of Education, Jefferson City. Vocational Rehabilitation Section
MF AVAILABLE IN VT-ERIC SET.
Pub Date - 67 128p.

*STATE STANDARDS; *REHABILITATION PROGRAMS; *SHELTERED WORKSHOPS; *VOCATIONAL TRAINING CENTERS; SPECIAL SERVICES; HANDICAPPED; STATE AGENCIES; *FACILITY GUIDELINES; FACILITY INVENTORY; DEMOGRAPHY; INTERAGENCY COORDINATION
MISSOURI

The initial Missouri State Workshops and Rehabilitation Facilities Plan includes (1) an inventory of existing workshops and rehabilitation facilities within the State and a description of services provided therein, (2) an evaluation of utilization patterns of existing workshops and facilities and their utilization potential, (3) a determination of needs for new workshops and facilities throughout the State, (4) a description of continuing activities of the state agency in the area of workshops and rehabilitaton facilities, and (5) a description of continuing coordination of planning. The State is divided into 20 planning areas for the purpose of developing the State Plan for workshops and rehabilitation facilities. In general most of the rehabilitation facilities and workshops are operating near capacity, and an analysis of the percentage of total client load receiving workshop and rehabilitation facility services indicates a need for more facilites located in certain geographic areas. The major population and rehabilitation facility and workshop services are in Kansas City and St. Louis metropolitan areas. The aggregate amount of services in these areas is inadequate for meeting the needs of the severely disabled, mentally ill, and mentally retarded. Metropolitan areas lack sufficient services and rural areas lack essential services. Maps showing client data are included. Appendixes provide an inventory of activities, a utilization schedule, and demographic data on planning areas. (HC)

## ACKNOWLEDGMENTS

Putting something into writing regarding the assistance which has been forthcoming in preparation for this, the initial State Plan for Workshops and Rehabilitation Facilities, is a pleasure, however, one beset by pitfalls due to the active participation of those called upon to serve. The list which follows is only a partial roster identifying contributors to this document, and for this reason I wish to apologize to those whom I have inadvertently neglected to recognize.

Any imperfections or shortcomings of this Plan are the onus of the project director and should in no way reflect upon the leadership and guidance provided by those respresented below:

Missouri State Employment Service
Missouri Division of Health
Special Education Section
  Missouri State Department of Education
Sheltered Workshop Section
  Missouri State Department of Education
Missouri Division of Mental Diseases
Missouri Division of Commerce and
 Industrial Development
Missouri State Sanatorium, Mt. Vernon
The many workshop and rehabilitation
 facility staff who provided data for
 the Inventory and Utilization Schedule
Mr. Henry Redkey, Chief, Division of
 Rehabilitation Facilities and Workshops
 and other VRA staff
The State Advisory Committee for Workshops
 and Rehabilitation Facilities
Mr. V. S. Harshbarger, Chief,
  Bureau for the Blind
  Division of Welfare
Mr. Bernard Preuss, Supervisor
  Business Enterprises and Facilities
  for the Blind
Mr. Joy O. Talley, Director
  Section of Vocational Rehabilitation
  Missouri State Department of Education
Mr. Stuart Zimmerman, Research Analyst
  Section of Vocational Rehabilitation
  Missouri State Department of Education
Mr. Cecil Brown, State Supervisor of
  Rehabilitation Units in State Institutions
  Section of Vocational Rehabilitation
  Missouri State Department of Education
Mrs. James Murphy, Secretary
  Section of Vocational Rehabilitation
  Missouri State Department of Education

Respectfully submitted,

Robert H. Prouty
Project Director

# INTRODUCTION

The 1965 amendments to the Vocational Rehabilitation Act represent major additions to the Federal law under which the Vocational Rehabilitation Administration functions. In the main, the 1965 amendments were designed to meet obvious needs for programs and activities not heretofore provided for in the Federal law. At the same time, certain of the amendments build upon and improve several programs which have been in operation for many years.

Therefore, in noting the changes in law (PL 89-333), it is well to have in mind the features of the programs which have been carried out since 1954.

The basic Federal-State program of vocational rehabilitation (in operation in one form or another since 1920) provides a wide array of rehabilitation services to disabled people--medical, surgical, psychological, and other services; prosthetic and orthotic devices where needed; educational and training services in preparation for employment; tools, equipment and licenses where needed; placement in a job and follow-up. Basic to all these is rehabilitation counseling, as a means of analyzing the disabled person's problems and needs, developing a rehabilitation plan and carrying it out.

This basic program has been jointly financed by the Federal government and the States. Federal funds have been allotted among the States according to a formula in the Act which recognized each State's population and per capita income squared in relation to the nation. (This allotment formula remains unchanged by the 1965 amendments.) The Federal share of the costs of the Federal-State program has been determined also by a formula in the previous Act; it has varied from State to State, with a minimum Federal share of 50% and a maximum of 70%.

Under the previous Act, a separate grant program for Extension and Improvement projects was conducted, to encourage and assist States in developing new features or extending services to disabled groups and geographic areas previously serviced inadequately. Federal funds for this program have been allotted among the States on the basis of population. (This allotment method also remains unchanged by the 1965 amendments.) The Federal share for such Extension and Improvement projects has been a flat 75% for all projects in all States, with Federal funds limited to three years for any one project.

A program of Research and Demonstration grants has been conducted, to secure new knowledge and develop new methods in rehabilitation, and to help finance projects to demonstrate improved procedures and methods for the benefit of State and community service programs. Grants for these purposes have been made to universities, rehabilitation centers, scientific institutions, hospitals, sheltered workshops, State rehabilitation agencies, voluntary and professional groups, and others. Federal grant funds have been furnished to pay part of the cost of such projects; the proportion of Federal funds has varied from one project to another.

A program of Training grants has been conducted to give financial assistance to universities and other teaching institutions for the conduct of training in various disciplines in rehabilitation; to provide traineeships for students; and to support short-term specialized training. In the training program, Federal funds also pay a part of the cost. In addition, a modest program of research fellowships has been carried out, primarily to increase the supply of rehabilitation personnel who are trained in research methods.

Since 1960, an international rehabilitation research program has been in operation by the Vocational Rehabilitation Administration. Grants have been made to various institutions and organizations abroad to pursue research in various aspects of rehabilitation and to carry out demonstration projects. This has been financed with foreign currencies owned by the United States in these foreign countries as a result of the sale of surplus United States commodities abroad.

All of these programs continue in operation following the 1965 amendments, with certain changes. Please refer to Exhibit C regarding provision of Aid to Rehabilitation Facilities and Workshops. Your attention is directed particularly to Section 12--Planning Grants for Workshops and Rehabilitation Facilities.

The regulations of the Vocational Rehabilitation Administration pertaining to Planning Grants for Workshops and Rehabilitation Facilities are described in the Federal Register, Volume 31, Number 9 dated January 14, 1966, Section 401.140 through 401.147. Planning grants are authorized in Section 12 (g) (1) of the Act (PL 89-333) for the purpose of paying part of the cost of organized efforts by the State Vocational Rehabilitation agency in making an initial determination of the State's needs for workshops and rehabilitation facilities and to provide for a continuing program for assessing such needs and evaluating activities for establishment, construction, utilization, development and improvement of the workshops and rehabilitation facilities.

The regulations further specify that a single application shall be made by each state for a grant for a State planning project for workshops and rehabilitation facilities. In those states in which there is a separate agency for the blind, application may be made by either agency provided that the other agency submits in writing an endorsement of the application indicating agreement with the objectives and program stated therein and support for the project. The Section of Vocational Rehabilitation (general agency) has submitted such an application with the endorsement of Mr. V. S. Harshbarger, Chief, Bureau for the Blind, Divison of Welfare.

The Section of Vocational Rehabilitation has complied with the requirements for the initial grant for the State Plan for Workshops and Rehabilitation Facilities by designating the individual with primary responsibility for implementation of the project activities; describing the nature and scope of the activities to be undertaken during the initial grant period and during the remainder of the project period (up to July 1, 1970) and the methods to be used in accomplishing the purpose of the project; proposing a budget; describing the number and qualifications of the staff to be assigned to carry out effectively the purposes of the project; describing the methods by which representatives from public and other non-proft agencies interested in the establishment and utilization of workshops and rehabilitation facilities will be involved in the planning effort as an Advisory Council; describing how this plan effort will be closely coordinated with the Missouri Comprehensive Rehabilitation Survey and Planning Project and other related planning in the State authorized under the Vocational Rehabilitation Act or other authority; agreeing to make such financial and administrative reports and keeping such records and accounts as the Commissioner of the Vocational Rehabilitation Administration may require and making such records and accounts available for audit purposes; agreeing to submit a project report hereinafter referred to as the Workshops and Rehabilitation Facilities Plan to the Regional Assistant Commissioner at the termination of the initial State planning grant; and providing such other information as the Commissioner of the

Vocational Rehabilitation Administration may require. The State Workshops and Rehabilitation Facilities Plan includes (a) an inventory of existing workshops and rehabilitation facilities within the State, or which can be readily utilized although located outside the State, and a description of services provided therein; (b) an evaluation of utilization patterns of existing workshops and facilities and their utilization potential; (c) a determination of needs for new workshops and rehabilitation facilities throughout the State including (1) relative needs on a geographical and disability basis, (2) a priority list of programmed projects over a short-range period, and (3) long-range goals through 1975; (d) a description of continuing activities of the State agency in the area of workshops and rehabilitation facilities as evidenced by anticipated programs under the Vocational Rehabilitation Act, the Medical Facilities Survey and Construction Act, the Mental Retardation Facilities and Community Mental Health Centers Construction Act, and other pertinent authority; (e) a description of continuing coordination of this planning with other planning activities within the State which involve workshops and rehabilitation facilities; and (f) such other information as the Commissioner of the Vocational Rehabilitation Administration may require.

# PROFILE OF MISSOURI

There is a great geographic variation within the boundaries of the 114 counties and the City of St. Louis in Missouri. Much of northern and western Missouri is representative of midwestern flat country, while there is a mountainous area in the south central region which is noted for its rugged individualists. In the southeast, Lowlands predominate in an area which is truly southern in culture and economy.

The population distribution of the State is a significant factor in providing workshops and rehabilitation facility services. There are two rather large metropolitan areas, namely St. Louis on the east boundary of the State and Kansas City on the west. Two smaller areas with populations of consequence are Springfield in the southwest and St. Joseph in the northwest. These cities together with the University of Missouri and its Medical School in Columbia enjoy most of the professional manpower resources of the State.

For the purpose of development of the State Plan for Workshops and Rehabilitation Facilities, the State has been divided into 20 planning areas. These planning areas are congruent with those of the Comprehensive Statewide Plan for Vocational Rehabilitation Services. The boundaries of the planning areas were developed originally by the Office of State and Regional Planning and Community Development. It is interesting to note that there is a large degree of overlap among the planning areas of the State Plan for Workshops and Rehabilitation Facilities, Missouri's Eleven Mental Retardation Planning Areas and the Thirteen Mental Health Center Service Areas (See Exhibits D, E and F).

Planning Area No. 1 is made up of Atchison, Holt, Nodaway, Andrew, Worth, Gentry, DeKalb and Clinton Counties in the extreme northwestern corner of Missouri. These counties are bordered on the north by Iowa and on the west by Nebraska and Kansas. The 1965 estimate of total population was 72,355. The civilian work force was estimated in 1965 as 27,390 with the exclusion of Andrew County for which such data was not available. The range of county median number of years in education is from 8.8 to 10.0 years in school. The 1965 estimate of effective buying income per household by county was from $4,124 to $6,081.

The total number of recipients of Aid to the Blind who are residents is 84. There are 10 blind individuals living there who are receiving vocational rehabilitation services through the Bureau for the Blind, Division of Welfare. 78 residents were admitted to state mental hospitals during 1965. In 1965, 57 resident patients in state facilities for the mentally retarded were from Area 1. During the current school year 1966-67, 10 mentally retarded students are enrolled in special education classes at the secondary level. A total of 12 individuals were admitted to the State Sanatorium, Mt. Vernon, Missouri, during 1965. In January 1966, there were 27 physicians with the M.D. degree and 26 with the D.O. degree residing there.

Planning Area No. 2 is located in north central Missouri and composed of nine rather rural counties. It is bounded on the north by the State of Iowa. The counties are Harrison, Daviess, Caldwell, Mercer, Grundy, Livingston, Putnam, Sullivan and Linn. The estimate of total population

in 1965 was 82,865. The civilian work force was estimated in 1965 at 38,233. The range of county median number of years in education is from 8.9 to 10.2 years in school. The 1965 estimate of effective buying income per household by county was from $4,319 to $5,497.

The total number of recipients of Aid to the Blind who are residents is 185. There are 22 blind individuals receiving vocational rehabilitation services through the Bureau for the Blind, Division of Welfare. During 1965, 96 residents were admitted to state mental hospitals. In 1965, 79 patients in state facilities for the mentally retarded were listed as residents of Area 2. 51 mentally retarded students are enrolled in special education classes at the secondary level during the current school year 1966-67. A total of 23 residents were admitted to the State Sanatorium, Mt. Vernon, during 1965 . There were 44 physicians with the D.O. degree and 36 with the M.D. degree residing in Area 2 in January, 1966.

Planning Area No. 3 is composed of Schuyler, Adair, Macon, Scotland, Clark, Knox, Lewis, Shelby, Marion, Monroe, Ralls and Pike Counties and is located in the northeastern corner of Missouri. This Area is bordered on the north by Iowa and on the east by Illinois. The total population as estimated in 1965 was 137,405. In 1965, the civilian work force was estimated at 56,216 excluding Ralls County for which this information was not available. The range of county median number of years in education is from 8.9 to 10.6 years in school. The 1965 estimate of effective buying income per household by county was from $4,121 to $6,287.

Recipients of Aid to the Blind in the Area total 202. 12 blind persons are receiving vocational rehabilitation services through the Bureau for the Blind, Division of Welfare. Admissions to state mental

hospitals during 1965 were 213. In 1965, there were 105 patients in state facilities for the mentally retarded who listed this Area as their residence. There are 83 mentally retarded students enrolled in special education classes at the secondary level during the current school year 1966-67. A total of 50 residents were admitted to the State Sanatorium, Mt. Vernon, during 1965. In January 1966, 60 physicians with the M.D. degree and 149 physicians with the D.O. degree were residing in this Area.

Planning Area No. 4 includes the counties of Platte, Clay, Cass and Jackson including Kansas City. These counties are located along the western border of Missouri. Total estimate of population in 1965 was 838,803. The estimate of the civilian work force in 1965 was 317,667. The range of county median number of years in school is 11.2 to 12.1. The effective buying income per household as estimated in 1965 was $6,504 to $8,921.

Residents of this Area who are recipients of Aid to the Blind total 654. 77 individuals are receiving vocational rehabilitation services through the Bureau for the Blind, Division of Welfare. During 1965, 1,342 persons were admitted to state mental hospitals. 476 patients in state facilities for the mentally retarded were from Area 4 in 1965. During the current school year 1966-67, there are 1,128 mentally retarded students enrolled in special education classes at a secondary level. In 1965, 46 individuals were admitted to the State Sanatorium, Mt. Vernon. Residing in this area in January 1966, there were 984 physicians with the M. D. degree and 299 physicians with the D. O. degree.

Planning Area No. 5 is made up of Ray, Lafayette and Johnson Counties. The 1965 estimate of total population was 73,676. The civilian work force was estimated in 1965 as 23,200. The range of county median number of years in school is from 8.9 to 11.5. In 1965, the estimate of effective buying income per household by county was from $5,871 to $6,592.

111 residents of this Area are recipients of Aid to the Blind. 9 are receiving vocational rehabilitation services through the Bureau for the Blind, Division of Welfare. During 1965, 73 individuals were admitted to state mental hospitals. Patients in state facilities for the mentally retarded in 1965 numbered 50 from this Area. 11 mentally retarded students are enrolled in special education classes at the secondary level during the current school year 1966-67. In 1965, 17 persons were admitted to the State Sanatorium, Mt. Vernon, Missouri. In January 1966, there were 35 physicians with the M. D. degree and 16 physicians with the D. O. degree living in Area No. 5.

Planning Area No. 6 is composed of five counties, namely Bates, Henry, Vernon, St. Clair and Cedar. These counties are located on the western boundary of the State. The total population as estimated in 1965 was 65,472. During 1965, the civilian work force was estimated at 27,990. The range of county median number of years in education is from 8.7 to 8.9 years in school. The 1965 estimate of effective buying income per household by county was from $4,258 to $6,493.

120 individuals living in this Area are receiving Aid to the Blind. 13 blind persons are receiving vocational rehabilitation services through the Bureau for the Blind, Division of Welfare. There were 135 residents admitted to state mental hospitals during 1965. In 1965, 49 patients in state facilities for the mentally retarded were from this Area. Mentally

retarded students enrolled in special education classes during the current school year 1966-67 total 12. There were 38 individuals admitted to the State Sanatorium, Mt. Vernon, during 1965. There were 45 physicians with the M. D. degree and 26 physicians with the D. O. degree residing in this area in January 1966.

Planning Area No. 7 contains Barton, Jasper, Newton and McDonald Counties in the extreme southwest corner of the State and borders on Oklahoma, Kansas and Arkansas. The total population as estimated in 1965 was 123,229. 51,120 of these individuals were included in the civilian work force as estimated in 1965. The range of county median number of years in education is from 8.8 to 10.0 years in school. The estimate of effective buying income per household by county during 1965 was from $4,253 to $6,345.

The total number of residents receiving Aid to the Blind is 221. 26 blind individuals are receiving vocational rehabilitation services through the Bureau for the Blind, Division of Welfare. There were 158 residents admitted to state mental hospitals during 1965. In 1965, Area No. 7 had 76 residents as patients in state facilities for the mentally retarded. During the current school year 1966-67, 110 mentally retarded students are enrolled in special education classes at the secondary level. A total of 197 individuals were admitted to the State Sanatorium, Mt. Vernon, during 1965. There were 81 physicians with the M. D. degree and 53 physicians with the D. O. degree residing in Area 7 in January 1966.

Planning Area No. 8 is made up of Dade, Polk, Lawrence, Barry, Stone, Christian and Taney Counties. These counties are on the southwestern edge of Missouri and are bordered on the south by Arkansas. In 1965, the total population was estimated at 97,761. The civilian work force as estimated in 1965 was 39,117. The range of county medican number of years in school is from 8.6 to 9.2. The 1965 estimate of effective buying income per household by county was from $4,028 to $5,373.

The total number of recipients of Aid to the Blind who are residents is 176. 20 blind persons are receiving vocational rehabilitation services through the Bureau for the Blind, Division of Welfare. In 1965, there were 141 residents admitted to state mental hospitals. 68 individuals from this Area were patients in state facilities for the mentally retarded during 1965. 163 mentally retarded students are enrolled in special education classes at the secondary level during the current year 1966-67. Admissions to the State Sanatorium, Mt. Vernon, during 1965 totaled 170 from this Area. In January 1966, there were 52 physicians with the M. D. degree and 29 physicians with the D. O. degree residing in this Area.

Planning Area No. 9 is composed of Benton, Hickory, Morgan, Camden, Dallas, Moniteau, Miller, Laclede and Cole Counties. This Area is located in the south central part of the State. The total population as estimated in 1965 was 120,413. In 1965, the civilian work force was estimated at 51,300. The range of county median number of years in education is from 8.6 to 9.9. The 1965 estimate of effective buying income per household by county was from $4,166 to $5,236.

Residents who are recipients of Aid to the Blind total 168. There are 17 blind individuals living there who are receiving vocational rehabilitation services through the Bureau for the Blind, Division of Welfare. During 1965, 213 residents were admitted to state mental hospitals. 83 individuals were patients in state facilities for the mentally retarded in 1965. There are 182 mentally retarded students enrolled in special education classes at the secondary level during the current school year 1966-67. In 1965, a total of 53 individuals were admitted to the State Sanatorium, Mt. Vernon, from this Area. 86 physicians with the M. D. degree and 51 physicians with the D. O. degree were residing in this Area in January 1966.

Planning Area No. 10 is made up of Carroll, Chariton, Saline and Pettis Counties. The 1965 estimate of population was 81,592. 35,110 was the estimate of the civilian work force in 1965. The range of county median number of years in school is from 8.9 to 9.3. The effective buying income per household by county as estimated in 1965 was from $4,996 to $6,508.

There are 119 residents who are receipients of Aid to the Blind. 18 blind persons are receiving vocational rehabilitation services through the Bureau for Blind, Division of Welfare. During 1965, 105 individuals were admitted to state mental hospitals. In 1965, 61 residents were patients in state facilities for the mentally retarded. Students enrolled in special education classes at the secondary level from this Area during the current school year 1966-67 total 40. There were 17 admissions to the State Sanatorium, Mt. Vernon, from this Area during 1965. In January 1966, there were 58 physicians with the M. D. degree and 24 physicians with the D. O. degree residing in This Area.

Planning Area No. 11 is located in the central part of Missouri and is composed of Randolph, Howard, Cooper, Boone, Audrain and Callaway Counties. In 1965, the estimate of total population was 161,663. The civilian work force was estimated in 1965 as 67,410. The range of county median number of years in education is from 8.9 to 12.1 years in school. The 1965 estimate of effective buying income per household by county was from $5,906 to $8,854.

The total number of recipients of Aid to the Blind who are residents is 232. 21 blind individuals living there are receiving vocational rehabilitation services through the Bureau for the Blind, Division of Welfare. Admissions to state mental hsoptials during 1965 totaled 237 from this Area. In 1965, 92 residents were patients in state facilities for the mentally retarded. During the current school year 1966-67, 269 students are enrolled in special

education classes at the secondary level. A total of 41 individuals were admitted to the State Sanatorium, Mt. Vernon, during 1965. Residing in Area No. 11 in January 1966, there were 286 physicians with the M. D. degree and 39 physicians with the D. O. degree.

Planning Area No. 12 consists of Montgomery, Lincoln, Warren and Franklin Counties. The estimate of total population in 1965 was 83,011. In 1965, the civilian work force was estimated as 29,132. The range of county median number of years in education is from 8.7 to 8.8. The 1965 estimate of effective buying income per household by county was from $5,109 to $6,498.

The total number of residents receiving Aid to the Blind is 80. 13 blind individuals are receiving vocational rehabilitation services through the Bureau for the Blind, Division of Welfare. During 1965, 80 persons were admitted to state mental hospitals from this Area. 41 patients in state facilities for the mentally retarded in 1965 were residents of Area 12. During the current school year 1966-67, 60 mentally retarded students are enrolled in special education classes at the secondary level. A total of 19 individuals were admitted to the State Sanatorium, Mt. Vernon, during 1965. 37 physicians with the M. D. degree and 19 physicians with the D. O. degree were residing in this Area in January 1966.

Planning Area No. 13 is made up of Osage, Maries, Pulaski, Gasconade, Phelps, Crawford and Dent Counties. In 1965, the estimate of total population was 116,761. The civilian work force in 1965 totaled 37,000. The range of county median number of years in school is from 8.5 to 11.1. The effective buying income per household by county as estimated in 1965 was from $4,251 to $8,142.

There are 110 residents receiving Aid to the Blind. 17 blind individuals are receiving vocational rehabilitation services through the Bureau for the Blind, Division of Welfare. Admissions to state mental hospitals during 1965 included 130 residents from this Area. In 1965, 39 patients in state facilities for the mentally retarded were from Area 13. There are a total of 163 mentally retarded students enrolled in special education classes at the secondary level during the current school year 1966-67. During 1965, a total of 42 persons were admitted to the State Sanatorium, Mt. Vernon. In January 1966, there were 33 physicians with the M. D. degree and 23 physicians with the D. O. degree residing in this Area.

Planning Area No. 14 is located on the southern boundary of Missouri. This Area is bordered on the south by Arkansas and consists of Wright, Douglas, Ozark, Texas, Howell, Shannon and Oregon Counties. The 1965 estimate of total population was 76,673. The civilian work force was estimated in 1965 as 29,730. The range of county median number of years in education is from 8.3 to 8.7. In 1965, the estimate of effective buying income per household by county was from $4,099 to $4,811.

Residents who are receiving Aid to the Blind total 259. There are 25 blind persons receiving vocational rehabilitation services through the Bureau for the Blind, Division of Welfare. 128 residents were admitted to state mental hospitals during 1965. Patients in state facilities for the mentally retarded from Area 14 numbered 49 in 1965. During the current school year 1966-67, 200 mentally retarded students are enrolled in special education classes at the secondary level. 80 individuals were admitted to the State Sanatorium, Mt. Vernon, during 1965. 22 physicians with the M. D.

degree and 23 physicians with the D. O. degree were residing in Area 14 in January 1966.

Planning Area No. 15 is located in the southeastern part of the State of Missouri and is composed of Reynolds, Carter, Ripley, Wayne and Butler Counties. The estimate of total population in 1965 was 53,384. In 1965, the civilian work force was estimated at 20,050. The range of county median number of years in school is from 8.2 to 8.4. The effective buying income per household by county was estimated in 1965 as from $3,769 to $5,719.

There are 165 residents who are receiving Aid to the Blind. 23 blind individuals are receiving vocational rehabilitation services through the Bureau for the Blind, Division of Welfare. In 1965, 108 residents were admitted to state mental hospitals. There were 35 patients in state facilities for the mentally retarded in 1965 from Area 15. Mentally retarded students enrolled in special education classes at the secondary level number 157 during the current school year 1966-67. In 1965, 38 residents were admitted to the State Sanatorium, Mt. Vernon. There were 46 physicians with the M. D. degree and 11 physicians with the D. O. degree residing in Area 15 in January 1966.

Planning Area No. 16 is bordered on the east by Illinois and is made up of Washington, Iron, St. Francois, Madison, Ste. Genevieve, Perry, Bollinger and Cape Girardeau Counties. The total population as estimated in 1965 was 137,450. In 1965, the civilian work force was estimated at 51,950. The range of county median number of years in school is from 8.1 to 9.0. The 1965 estimate of effective buying income per household by county was from $4,125 to $7,079.

The total number of recipients of Aid to the Blind who are residents is 198. There are 32 blind individuals living there who are receiving vocational rehabilitation services through the Bureau for the Blind, Division of Welfare. 247 residents were admitted to state mental hospitals during 1965. In 1965, 82 residents of Area 16 were patients in state facilities for the mentally retarded. During the current school year 1966-67, 189 mentally retarded students are enrolled in special education classes at the secondary level. A total of 49 individuals were admitted to the State Sanatorium, Mt. Vernon, during 1965. In January 1965, there were 107 physicians with the M. D. degree and 32 physicians with the D. O. degree living in Area 16.

Planning Area No. 17 is in the most southeastern part of the State and is made up of Stoddard, Dunklin, Scott, New Madrid, Pemiscot and Mississippi Counties. It borders on Arkansas, Tennessee and Kentucky. In 1965, the total population was estimated as 168,462. The civilian work force was estimated as 61,320 in 1965. The range of county median number of years in education is from 7.5 to 8.6. The effective buying income per household by county as estimated in 1965 was from $4,508 to $5,923.

Residents who are recipients of Aid to the Blind total 466. Vocational rehabilitation services through the Bureau for the Blind, Division of Welfare, are being received by 73 blind individuals. There were 273 individuals admitted to state mental hospitals during 1965. In 1965, 102 patients in state facilities for the mentally retarded were from Area 17. There are 420 mentally retarded students enrolled in special education classes at the secondary level during the current school year 1966-67. 166 individuals were admitted to the State Sanatorium, Mt. Vernon,

during 1965. 82 physicians with the M. D. degree and 26 physicians with the D. O. degree were residing in this Area in January 1966.

Planning Area No. 18 is an urban area and consists of St. Charles, St. Louis and Jefferson Counties and the City of St. Louis. the 1965 estimate of total population was 1,782,839. In 1965, the civilian work force was estimated as 580,550.. The range of county median number of years in school is from 8.9 to 11.7. The estimated effective buying income per household by county was from $7,325 to $9,410 in 1965.

There are 960 residents who are recipients of Aid to the Blind. 63 blind individuals are receiving vocational rehabilitation services through the Bureau for the Blind, Division of Welfare. In 1965, 2,101 persons were admitted to state mental hospitals. 884 were patients in state facilities for the mentally retarded during 1965. During the current school year 1966-67, there are 958 mentally retarded students enrolled in special education classes at the secondary level. 68 residents from Area 18 were admitted to the State Sanatorium, Mt. Vernon, during 1965. In January 1966, there were 2,356 physicians with the M. D. degree and 177 physicians with the D. O. degree residing in this Area.

Planning Area 19 is located on the western edge of Missouri and is made up of only one county which is Buchanan County. In 1965, the total population was estimated at 83,508. The 1965 estimate of civilian work force totaled 37,980. The county median number of years in education is 9.9. The 1965 estimate of effective buying income per household was $7,560.

The total number of recipients of Aid to the Blind who are residents is 91. There are 31 blind individuals living there who are receiving vocational rehabilitation services through the Bureau for the Blind,

Division of Welfare. Admissions to state mental hospitals during 1965 numbered 181 from this Area. In 1965, 60 patients in state facilities for the mentally retarded were from Area 19. 35 mentally retarded students are enrolled in special education classes at the secondary level during the current school year 1966-67. A total of 16 individuals were admitted to the State Sanatorium, Mt. Vernon, in 1965. 96 physicians with the M. D. degree and 17 physicians with the D. O. degree were living in Area 19 in January 1966.

Planning Area No. 20 is Greene County. The 1965 estimate of total population was 133,516. In 1965, the estimate of the civilian work force was 55,370. The median number of years in school is 10.8. The 1965 estimate of effective buying income per household was $7,047.

130 residents are recipients of Aid to the Blind. 29 blind persons are receiving vocational rehabilitation services through the Bureau for the Blind, Division of Welfare. There were 147 admissions to state mental hospitals from this Area during 1965. A total of 58 residents were patients in state facilities for the mentally retarded in 1965. During the current school year 1966-67, 346 students are enrolled in special education classes at the secondary level. During 1965, 99 individuals were admitted to the State Sanatorium, Mt. Vernon. In January 1966, there were 181 physicians with the M. D. degree and 20 with the D. O. degree living in Area 20.

SUMMARY:

The population of the planning areas varies from a high of 1,782,839 for Area 18 which includes St. Louis City to a low of 53,384 for Area 15 in southeast Missouri. There are large forest tracts including part of the Mark Twain National Forest, all of Clark National Forest and several State forest regions in this planning area. The same two areas contained the largest and smallest number of civilian workers in 1965; namely, 580,550 in Area 18 and 20,050 in Area 15.

When comparisons are made of median number of years in school by county, Areas 4 (Kansas City Metropolitan) and 11 (Columbia) tie with a county in each with a median of 12.1. The Area which has the dubious distinction of embodying the county with the lowest median (7.5) is number 17 in the Bootheel.

With a range of $7,325-$9,410, Area 18 (St. Louis) had the highest estimate of effective buying income per household; followed by $6,504-$8,921, Area 4 (Kansas City) and $5,906-$8,854, Area 11 (Columbia). Area 15 with $3,769-$5,719 had the lowest estimate for 1965.

The number of recipients of Aid to the Blind is highest in the two most populous areas, 18 and 4; and lowest in Area 12 bordering on the St. Louis area. Area 5 (adjoining Kansas City) had the fewest blind (9) receiving vocational rehabilitation services while Areas 18 and 4 had the most, 960 and 654 respectively. This same trend of least in Area 5 and most in Areas 18 and 4 also holds true for admissions to the state mental hospitals in 1965. Thirty-five patients in state facilities for the mentally retarded gave counties in Area 15 as their residence while 884

listed Area 18 and 476 listed Area 4. The pattern for mentally retarded students enrolled this school year in special education programs at the secondary level is as anticipated. Area 18 leads with 1,399 followed by Area 4 with 1,128. Areas 1, 5 and 6 are lowest with 10, 11 and 12 respectively.

Area 7 in the southwest corner of the State had the most (197) patients admitted to the State Sanatorium, Mt. Vernon, in fiscal year 1965. This was followed by Area 8 (170), the area in which the hospital is located, and then Area 17, Missouri's Bootheel, with 166. Area 1 in the northwest corner of the State had the fewest admissions with 12.

Of the 5,814 physicians registered and living in Missouri, in January 1966, 4,710 were M. D.'s and 1,104 were D. O.'s. The ratio of M. D.'s to D. O.'s was more than four to one. This ratio varies widely in the State as Exhibit G shows. Every county in the State had at least one physician. Ten counties had no M. D.'s while only one county had no D. O. Over two-thirds of all physicians lived in the metropolitan areas of St. Louis City, St. Louis County, Kansas City and Jackson County. These areas represently slightly over one-half of the population. The population to physician ratio was 743 people to each registered physician living in Missouri. The more favorable ratio was in the urban areas as indicated above. It should be noted that urban areas would have more industrial and governmental physicians not in private practice.

## INVENTORY OF REHABILITATION FACILITIES AND WORKSHOPS

At this time there are no known rehabilitation facilities or sheltered workshops within the definition given in Exhibit A in Area 1. However, a Regional Diagnostic and Evaluation Clinic for the Mentally Retarded is planned to be located at Albany, Missouri. This facility will be administered by the Division of Mental Diseases. Nine such facilities are being planned for the State of Missouri. The structures will house administrative offices, diagnostic and evaluation areas, a playroom, four classrooms and a 40 bed in-patient care center. Each clinic will provide meals to both in-patient and out-patient population.

There are no known rehabilitation facilities or sheltered workshops located in Planning Area No. 2.

Planning Area No. 3 has Regional Diagnostic and Evaluation Clinics for the Mentally Retarded planned for location at Hannibal and at Kirksville. The Northeast Missouri Sheltered Workshop, Inc., Hannibal, provides extended employment services to approximately 40 individuals with mental and other disabling conditions.

The Department of Rehabilitation, Kirksville College of Osteopathy and Surgery, provides the following services on both an in-patient and out-patient basis: physical and mental evaluation; medical management; physical therapy; occupational therapy; speech and hearing services; medical consultation; psychological services; social services; personal adjustment training and job conditioning. Orthopedic impairments, amputations, and other disabling conditions comprise the major disability groups served. Relocation of the Rehabilitation Department into an extended care facility is under consideration.

A Regional Diagnostic and Evaluation Clinic for the Mentally Retarded is also planned for Area 4 to be located in Kansas City. The Western Missouri Mental Health Center is also in Kansas City. Plans are currently being drawn up to establish a rehabilitation unit within the Western Missouri Mental Health Center.

The Rehabilitation Institute, Kansas City, serves the orthopedically impaired; the amputee; the mental; psychoneurotic with personality disorders and other disabling conditions in the main. Physical and medical evaluation; medical management; physical therapy; occupational therapy; speech and hearing services; medical consultation; psychological services; social services; vocational evaluation; pre-vocational and vocational training; vocational counseling; personal adjustment training; job conditioning; job placement; extended employment and transitional employment services are provided by this facility. At present, plans are approved for the construction of a new facility which will provide approximately 40 in-patient beds.

The Kansas City College of Osteopathy and Surgery, Department of Physical Medicine and Rehabilitation, provides services primarily to the orthopedically impaired, mental and other disabling conditions. This department provides physical and medical evaluation; medical management; physical therapy; speech and hearing services; medical consultation; psychological services; social services; personal adjustment training and job conditioning. A new hospital is in the planning stages and upon completion will provide services in many additional areas.

Hearing impairments; orthopedic impairments; mental, psychoneurotic and personality disorders; and other disabling conditions comprise the major disability groups served by Jewish Vocational Services, Kansas City. Medical consultation; psychological services; vocational evaluation; pre-vocational and vocational training; vocational counseling; personal adjustment training; job conditioning; job placement; extended employment and transitional employment are the services provided in this workshop.

The Greater Kansas City Sheltered Workshop, Inc., provides extended employment services to approximately 57 mentally retarded individuals on a year round basis.

The primary disability groups served by Goodwill Industries, Inc., Kansas City, are the orthopedically impaired; mental, psychoneurotic and personality disorders; and other disabling conditions. Services are provided in the following areas: physical and medical evaluation; medical management; medical consultation; psychological services; social services; vocational evaluation; pre-vocational and vocational training; personal adjustment training; job conditioning; job placement; extended employment and transitional employment.

Kansas City Blind Industries serves the visually impaired and those with other disabling conditions. In addition to the provision of braille books, tapes, a recreational center and a home for blind women; job conditioning; job placement; extended employment; and transitional employment services are provided.

There are no known rehabilitation facilities or sheltered workshops in Area 5.

State Hospital No. 3 is located in Planning Area No. 6. In cooperation with the Division of Mental Diseases, the Section of Vocational Rehabilitation, State Department of Education, operates a Rehabilitation Unit within this hospital.

A Regional Diagnostic and Evaluation Clinic for the Mentally Retarded is planned for Joplin in Area 7. A community mental health clinic grant has also been approved for this city. The Joplin Area Sheltered Workshop, Inc., provides extended employment services to approximately 25 mentally

retarded and individuals with other disabling conditions.

The Missouri State Sanatorium, a hospital for chest and respiratory diseases, is located at Mt. Vernon in Area 8. In cooperation with the State Sanatorium, the Section of Vocational Rehabilitation, State Department of Education, administers a rehabilitation unit within the hospital.

Planning Area No. 9 contains no known rehabilitation facilities or workshops.

The Sheltered Workshop of Pettis County, Inc., provides extended employment services to the mentally retarded and other disabled in Sedalia in Planning Area No. 10. The Marshall State School--Hospital is also in Area 10. Plans are currently being drawn up to establish a rehabilitation unit at the Marshall State School--Hospital.

In Planning Area No. 11, the Community Workshop, Columbia, is a new rehabilitation facility providing services mainly to the orthopedically impaired; the amputee; the mental, psychoneurotic and personality disorders and other disabling conditions. Psychological services; social services, vocational evaluation; pre-vocational and vocational training; personal adjustment training; job conditioning; job placement and transitional employment services are offered by this facility.

The Physical Medicine and Rehabilitation Section of the University of Missouri Medical Center, Columbia, provides the following services: physical and medical evaluation; medical management; physical therapy; occupational therapy; speech and hearing services; medical consultation; psychological services; social services; vocational evaluation; pre-vocational and vocational training; vocational counseling; personal adjustment training and job conditioning. Sixty beds have been assigned to the Physical Medicine and Rehabilitation Section.

State Hospital No. 1, Fulton, is also located in Area 11. Mexico has an application pending for a community mental health clinic. The Mid-Missouri Mental Health Center adjoins the University of Missouri Medical Center.

There are no known rehabilitation facilities or sheltered workshops located in Planning Area No. 12.

A Regional Diagnostic and Evaluation Clinic for the Mentally Retarded is planned for Rolla in Area 13.

Planning Area No. 14 contains no known rehabilitation facilities or workshops.

In Planning Area No. 15, a Regional Diagnostic and Evaluation Clinic for the Mentally Retarded is planned for Poplar Bluff. Dogwood Enterprises, Inc., Poplar Bluff, operates an extended employment sheltered workshop for approximately 36 mentally retarded and other disabled individuals.

State Hospital No. 4 at Farmington is in Planning Area No. 16. In cooperation with the Division of Mental Diseases, the Section of Vocational Rehabilitation operates a rehabilitation unit within this hospital. Cape Girardeau has expressed an active interest in a grant application for a community mental health clinic.

A Regional Diagnostic and Evaluation Clinic for the Mentally Retarded is planned for Sikeston in Area 17.

Planning Area No. 18 has the largest population and the most rehabilitation facility and workshop activities in the State. State Hospital No. 5, the Malcolm Bliss Mental Health Center and the St. Louis State School--Hospital are all located in the City of St. Louis.

The orthopedically impaired; amputees, mental, psychoneurotic and personality disorders; and other disabling conditions make up the major disability groups served by the Vocational Counseling and Rehabilitation Services, Inc., of St. Louis. This facility provides physical therapy;

occupational therapy; psychological services; vocational evalulation; pre-vocational and vocational training; vocational counseling; personal adjustment training; job conditioning; job placement; transitional employment; homebound employment and occupational therapy and physical therapy home service.

The Boone Center, Inc., in St. Charles provides extended employment services to approximately 20 individuals with mental retardation and other disabling conditions. The Services for Extended Employment & Development, Inc., Webster Groves, provide extended employment to approximately 40 mentally retarded individuals. The Universal Sheltered Workshop, Inc., in St. Louis provides extended employment to approximately 25 individuals with mental retardation and other disabling conditions. The Light House for the Blind, St. Louis, provides services primarily to the visually handicapped and individuals with other disabling conditions. Social services; vocational evaluation; pre-vocational and vocational training; job conditioning and extended employment are the areas of services offered by this facility.

Jewish Employment and Vocational Services, St. Louis, primarily serves the hearing impaired, orthopedically impaired, amputees and individuals with other disabling conditions. Physical and medical evaluation, psychological services; social services; vocational evaluation; pre-vocational and vocational training; vocational counseling; personal adjustment training; job conditioning; job placement; extended employment; and transitional employment are the services provided by this facility.

Orthopedic impairments and amputees are the major disability groups served by the Irene Walter Johnson Rehabilitation Institute, St. Louis.

Physical and medical evaluation; medical management; physical therapy; occupational therapy; speech and hearing services; medical consultation; psychological services; social services; vocational evaluation; personal adjustment training and job conditioning are the services offered by this rehabilitation facility which is affiliated with the Washington University School of Medicine.

The major disability groups served by the Division of Physical Medicine and Rehabilitation, Department of Long Term Care, Jewish Hospital, are the orthopedically impaired, amputees and individuals with other disabling conditions. Physical and medical evaluation, medical management, physical therapy, occupational therapy, speech and hearing services, medical consultation, psychological services, social services, vocational counseling, personal adjustment training and job conditioning are the services provided. Twenty-five beds have been assigned to "comprehensive rehabilitation."

The Rehabilitation Center, St. John's Mercy Hospital, Creve Coeur, stated that all six disability groups--visual impairments, hearing impairments, orthopedic deformity, amputations, mental, psychoneurotic and personality disorders and other disabling conditions are provided services and that each group comprises at least 10% of those receiving services. Physical and medical evaluation, medical management, physical therapy, occupational therapy, speech and hearing services, medical consultation, psychological services, social services, vocational evaluation, pre-vocational and vocational training, vocational counseling and personal adjustment are the services provided.

The Rehabilitation Section of Deaconess Hospital, St. Louis, provides services primarily to the orthopedically impaired, amputees, those with mental, psychoneurotic, personality disorders and individuals with other

disabling conditions. Physical and medical evaluation, medical management, physical therapy, occupational therapy, speech and hearing services, medical consultation, psychological services, social services and personal adjustment training are the services available through this facility.

Project Workshop, Inc., St. Louis, provides extended employment services to an average of 58 mentally retarded individuals daily. Project, Inc., St. Louis, provides psychological services, vocational evaluation, pre-vocational and vocational training, vocational counseling, personal adjustment training, job conditioning, job placement and transitional employment to an average daily caseload of 25 mentally retarded individuals.

The Rehabilitation Department of Missouri Baptist Hospital, Town and Country, provides physical and medical evaluation, medical management, physical therapy, occupational therapy, medical consultation, personal adjustment training and job conditioning services primarily to individuals with orthopedic impairments, amputations, and those with mental, psychoneurotic and personality disorders.

State Hospital No. 2, St. Joseph, is located in Area 19. At the present time, negotiations are underway with Goodwill Industries of Kansas City to operate a satellite type workshop and Goodwill Retail Store with a local group interested in sheltered workshop activities in St. Joseph. It is anticipated that this facility will become operational within the coming fiscal year. The Section of Vocational Rehabilitation operates a rehabilitation unit within State Hospital #2.

A Regional Diagnostic and Evaluation Clinic for the Mentally Retarded is scheduled for Area 20 in Springfield. Mental, psychoneurotic and personality disorders and individuals with other disabling conditions are the major disability groups served in the Springfield Workshop, Inc. This facility provides extended employment services to a daily average of 47 individuals.

The nine Regional Diagnostic and Evaluation Clinics for the Mentally Retarded scheduled for Missouri have been approved by the appropriate authorities and are in various stages of planning, construction and staff development at the present.

The quality of services currently being provided in each of the workshops and rehabilitation facilities is satisfactory. The staff and physical plant of these facilities meet the current standards as outlined in the State Plan for Administration of the Program of Vocational Rehabilitation in Missouri. A proposed staffing pattern is being developed by the Section of Vocational Rehabilitation which may result in upgrading staff of rehabilitation facilities and workshops. Upon adoption of such staffing patterns, an inventory of personnel of rehabilitation facilities and workshops will be done of those institutions providing services to the Section of Vocational Rehabilitation.

Relocation of the Rehabilitation Department, Kirksville College of Osteopathy and Surgery, is under consideration for the coming fiscal period and appears desirable. The new Rehabilitation Institute, Kansas City, is badly needed. Construction is scheduled to start on this project during the year. Construction of a new Kansas City College of Osteopathy and Surgery is under way and will enable the Physical Medicine and Rehabilitation Department to greatly expand its services. Community Workshop, Columbia, is making satisfactory progress for a new shop and will probably need different quarters and additional staff before the year is over.

## INVENTORY OF OUT-OF-STATE FACILITIES AND WORKSHOPS

During the current fiscal period, four out-of-state rehabilitation facilities have been utilized; namely, the Texas Institute for Rehabilitation and Research, Houston, Texas; the Institute for Physical Medicine and Rehabilitation, New York; the Hot Springs Rehabilitation Center, Hot Springs, Arkansas; and Oklahoma State Tech, Okmulgee, Oklahoma. Each of these facilities is a comprehensive rehabilitation facility providing a wide range of medical, social, psychological and vocational services. One individual is receiving services at the Texas Institute, one at the Institute for Physical Medicine and Rehabilitation, eight at Hot Springs Rehabilitation Center and twenty-three at Oklahoma State Tech. These 33 clients are all severely disabled. Three are quadriplegics, eight paraplegics, three hemiplegics, 6 have other severe neurological disorders, four are deaf, three are arthritic and six have other severe disabling conditions.

## UTILIZATION OF WORKSHOPS AND REHABILITATION FACILITIES

In March 1967, the staff of the Section of Vocational Rehabilitation had a total of 170 clients in Area 1. Of these clients three were receiving workshop services and four were receiving services in rehabilitation facilities. No one was reported as waiting for workshop services, rehabilitation facility services, or placement services. No one was reported as engaged in workshop employment.

In Area 2, 387 residents were clients of Vocational Rehabilitation. 11 individuals were receiving services from rehabilitation facilities. No one was receiving workshop services, waiting for workshop services, employed in a sheltered workshop, waiting for placement services or waiting for rehabilitation facility services.

In Area 3, 480 persons were clients of Vocational Rehabilitation. 37 were engaged in workshop employment and nine were receiving rehabilitation facility services. No one was receiving workshop services, awaiting workshop services, awaiting placement or waiting for rehabilitation facility services.

There are a total of 1,892 clients in Area 4. 39 of these individuals were receiving workshop services, 80 were waiting for workshop services, 434 were engaged in workshop employment, 87 were awaiting placement, 47 were receiving rehabilitation facility services and 50 were waiting for rehabilitation facility services.

In Area 5, 134 individuals were clients of Vocational Rehabilitation. 4 were receiving workshop services and 2 were receiving rehabilitation facility services. No one was waiting for workshop services, workshop employment, placement or for rehabilitation facility services.

In Planning Area No. 6, 254 individuals were clients of Vocational Rehabilitation. One person was receiving workshop services and three individuals were receiving rehabilitation facility services. No one was waiting for rehabilitation facility services, workshop services, workshop employment or placement.

386 persons were clients in Area 7. 28 individuals were waiting for workshop services, 22 were engaged in workshop employment and 8 were receiving rehabilitation facility services. No one was receiving workshop services, awaiting placement or waiting for rehabilitation facility services.

In Planning Area No. 8, there were 490 clients. One individual was receiving workshop services and four were receiving rehabilitation facility services. No one was waiting for workshop services, workshop employment, placement or for rehabilitation facility services.

There were 504 individuals in Planning Area No. 9 who were clients of Vocational Rehabilitation. 6 were receiving workshop services and 8 were receiving rehabilitation facility services. No one was waiting for workshop services, engaged in workshop employment, awaiting placement or waiting for rehabilitation facility services.

233 individuals in Planning Area No. 10 were clients. Two were receiving workshop services, 22 were engaged in workshop employment and 6 were receiving rehabilitation facility services. No one was reported waiting for workshop services, placement or rehabilitation facility services.

There were 274 clients in Planning Area No. 11. 17 of these individuals were receiving workshop services, 10 were engaged in workshop employment, 15 were receiving rehabilitation facility services and 30 were waiting for rehabilitation facility services. There was no one waiting for workshop services or for placement.

In Planning Area No. 12, there were 148 Vocational Rehabilitation clients. One person was receiving workshop services and three were receiving rehabilitation facility services. No one was waiting for workshop services, engaged in workshop employment, awaiting placement or rehabilitation facility services.

In Planning Area No. 13, there were 342 clients. 2 clients were receiving workshop services and 7 were receiving rehabilitation facility services. No one was waiting for workshop services, engaged in workshop employment, awaiting placement or waiting for rehabilitation facility services.

212 individuals in Planning Area No. 14 were clients. 5 persons were receiving rehabilitation facility services. No one was receiving workshop services, waiting for workshop services, engaged in workshop employment, waiting for placement or rehabilitation facility services.

In Planning Area No. 15, there were 271 clients. 36 individuals were engaged in workshop employment and 8 were receiving rehabilitation facility services. No one was receiving workshop services, waiting for workshop services, waiting for placement or rehabilitation facility services.

506 individuals in Planning Area No. 16 were clients. 2 clients were receiving workshop services and 7 were receiving rehabilitation facility services. No one was waiting for workshop services, engaged in workshop employment, awaiting placement or rehabilitation facility services.

In Planning Area No. 17, there were 650 clients. One person was receiving workshop services and 6 were receiving rehabilitation facility services. No one was waiting for workshop services, engaged in workshop employment, awaiting placement or rehabilitation facility services.

There were 3,224 clients in Planning Area No. 18. 121 persons were receiving workshop services, 18 were waiting for workshop services, 454 were engaged in workshop employment, 50 were awaiting placement, 194 were receiving rehabilitation facility services and 10 were waiting for rehabilitation facility services.

217 persons were clients in Area 19. 2 individuals were receiving rehabilitation facility services. No one was receiving workshop services, waiting for workshop services, engaged in workshop employment, awaiting placement or waiting for rehabilitation facility services.

There were 486 clients in Planning Area No. 20. One individual was receiving workshop services, 47 were engaged in workshop employment and 6 were receiving rehabilitation facility services. No one was waiting for placement, workshop services or rehabilitation facility services.

Please see Exhibits H, I, J, K, L, M and N for maps depicting total number of clients by county and/or planning area, number receiving workshop services, number waiting for workshop services, number engaged in workshop employment, number awaiting placement, number receiving rehabilitation facility services and number waiting for rehabilitation facility services.

When a comparison is made of the total number receiving workshop and rehabilitation facility services to the total number of Vocational Rehabilitation clients by Area, Area 11 (Columbia) with 11% is followed closely by Area 18 (St. Louis) with 10%. Area 4 (Kansas City) with 4.5% is third. Areas 19 (St. Joseph), 8 (southwest), 17 (bootheel), 20 (Springfield) and 6 (west) all have a percentage of 1.5% or lower. However, in drawing any conclusions from this date, one must remember that these figures were applicable to March 1967 and may have changed significantely since that date.

In general most of the rehabilitation facilities and workshops are operating near capacity. Some individual institutions in St. Louis and Kansas City report clients waiting for individual services, while others indicate they are not operating at capacity. Much of this variance is due to the program of the particular institution involved. In Columbia the Community Workshop is making good progress and the client load is growing each month to the place that it has almost doubled since the inventory was taken.

The major population and rehabilitation facility and workshop services are in Areas 4 and 18, Kansas City and St. Louis metropolitan areas. The aggregate amount of services in these areas are inadequate for meeting the needs of the severely disabled, mentally ill and mentally retarded. Metropolitan areas lack sufficient services and rural areas lack essential services. This situation not only promotes chronicity, but also makes early identification, evaluation and provision of services extremely difficult in rural areas.

## DETERMINATION OF NEEDS

When one looks at the need for workshops and rehabilitation facilities on a geographical basis, it becomes apparent that the existing institutions being utilized are located across the center of the State; starting in the east with St. Louis, and moving west to Columbia and Kansas City. Development of additional institutions providing an integrated program of medical, psychological, social and vocational evaluation and services under competent professional supervision in northeast, northwest, southeast and southwest sections of the State must receive early consideration in any statewide plan for workshops and rehabilitation facilities. An analysis of the percentage of total client load receiving workshop and rehabilitation facility services bears out the need for such geographically located facilities even before consideration is given to the location of the nine Regional Diagnostic and Evaluation Clinics for the Mentally Retarded; Albany (Area 1), Kirksville (Area 3), Hannibal (Area 3), Rolla (Area 13), Sikeston (Area 17), Poplar Bluff (Area 15), Joplin (Area 7), Springfield (Area 20) and Kansas City (Area 4). The demand which will be generated by the operation of these institutions can only be predicted to increase the need for workshops and rehabilitation facilities.

Part, or all, of the following planning areas could be served by a comprehensive institution in the northwest sector of the State: Areas 1, 2, 19 and 4.

Part, or all, of the following planning areas could be served by a comprehensive institution in the northeast sector of the State: Areas 2, 3, 10 and 11.

Part, or all, of the following planning areas could be served by a comprehensive institution in the southwest sector of the State: Areas 6, 7, 8, 9, 14 and 20.

Part, or all, of the following planning areas could be served by a comprehensive institution in the southeast sector of the State: Areas 14, 15, 16 and 18.

At this time the disability census in Missouri is in the preliminary stage. As mentioned earlier this census will be done by the Comprehensive Statewide Plan for Vocational Rehabilitation Services. Although when viewed from an empirical standpoint it appears that quadriplegics, paraplegics, mentally retardates and the mentally ill constitute the prime users of workshops and rehabilitation facilities; the project staff have been unable to find any studies to document this conclusion. Do these disability groups need and use workshop and rehabilitation facilities out of proportion to their relationship to the total number of disabled?

The series of Research and Demonstration Grants (1576, 1804 and 1932) establishing a set of guidelines for use in rehabilitating the deaf in multi-purpose facilities raises an interesting supposition. Interest has already been expressed in Missouri in rehabilitating the blind in additional existing selected workshops and rehabilitation facilities. If this can be accomplished through the provision of supplementary staff and equipment, the need for separate workshops and rehabilitation facilities for special disability groups may be minimized.

During the second meeting of the Advisory Committee on Workshops and Rehabilitation Facilities, twenty-six factors were identified as

significant priority considerations. The committee members were asked to complete the very difficult task of ranking these factors in order of significance. References provided for their guidance were excerpts from "Comprehensive Mental Health Planning in Missouri", "Missouri State Plan for Construction of Facilities for the Mentally Retarded", "Missouri State Plan for the Construction of Community Mental Health Centers" and Section 402.26 of the Federal Register, Volume 31, No. 9 "Factors considered in evaluating proposals". Understandably, not everyone was able to complete this undertaking; however, the composite rank order was as follows:

1. Total population of the Area
2. Area readiness to participate financially in project
3. Availability of professional manpower in the Area
4. Degree of utilization of existing workshops and rehabilitation facilities
5. Existence of workshops and/or facilities in the Area
6. Expression of interest of Area to participate in project
7. Vocational placement possibilities in the Area
8. Availability of complementary professional services
9. Vocational evaluation services
10. Distance from facility providing appropriate service
11. Vocational counseling - rehabilitation counseling
12. Physical and medical evaluation
13. Psychological services, diagnostic and treatment
14. Pre-vocational and vocational training
15. Job placement and services
16. Medical consultation
17. Personal adjustment training, including mobility

18. Job conditioning

19. Transitional employment

20. Social services

21. Extended employment

22. Physical therapy

23. Speech and hearing services

24. Occupational therapy

25. Degree of obsolescence of equipment

26. Medical management

A brief analysis of the composite rank order reveals that by and large at least two different classes of items are involved, namely, community characteristics and types of services provided in workshops and rehabilitation facilities. Those committee members (6) who were able to rank the factors were in common agreement as to the precedence of community characteristics over specific kinds of services. Interpretations as to the significance of individual item rank should be made with extreme caution. The range of sum of ranks between contiguous items varies from a low of zero to a high of twelve.

Taking the entire twenty-six factors into consideration, the following short range goals are put forth. As early as possible in fiscal year 1968, an inventory of the staffing patterns of existing institutions desiring to sell services to the Section of Vocational Rehabilitation will be completed. The results will be compared with the staffing pattern being developed and deficiencies abolished through the provision of Expansion or Workshop Improvement Grants to the extent that funds permit.

Additional institutions providing an integrated program of medical, psychological, social and vocational evaluation and services under competent

professional supervision will be promoted on a multi-area basis in the following priority order: southwest sector (Areas 6,7, 8, 9, 14 and 20), southeast sector (Areas 14, 15, 16 and 17), northeast sector (Areas 2, 3, 10 and 11) and northwest sector (Areas 1, 2, 19 and 4). Where it is reasonable to modify, renovate or expand an existing institution, such proposals will be reviewed together with any proposals to construct a new facility.

Long range plans through 1975 call for at least one workshop providing extended employment services in each planning area. (See Exhibit P for location of present workshops and rehabilitation facilities) Those areas which have no workshops or rehabilitation facilities are to be given priority in the development of workshops which initially program only for extended employment services.

## CONTINUING ACTIVITIES

The project director together with Mr. Talley, Director, Section of Vocational Rehabilitation, has reviewed Office of Economic Opportunity grant applications from two workshops, one at Columbia and one at Hannibal. These grants enabled the Community Workshop, Columbia, to begin operation and the Northeast Missouri Sheltered Workshop, Inc., Hannibal, to add to its professional staff.

He has also participated in discussions with community interest groups and personnel of the Section of Sheltered Workshops, State Department of Education, in regard to the establishment of extended employment sheltered workshops in various locations throughout Missouri.

The Section of Vocational Rehabilitation has actively participated with the staff of the Rehabilitation Institute, Kansas City, regarding the building of a new expanded facility which will be jointly funded through local financing, the Medical Facilities Survey and Construction Act and the Vocational Rehabilitation Administration. It is anticipated that ground will be broken for the new Rehabilitation Institute during the current year.

The State Agency has also been involved in the review and endorsement of a recent application for construction of a Rehabilitation Center as a part of the new Children's Mercy Hospital scheduled for Kansas City. This institution has made application for funding under the rehabilitation center category of the Medical Facilities Survey and Construction Act. Mr. Talley and the project director have made a site visit and held two conferences with personnel of Burge Protestant Hospital, Springfield,

regarding a free standing rehabilitation center on the hospital grounds. This applicant also has indicated a future interest in funds of the Medical Facilities Survey and Construction Act. Recent correspondence has been received from the Kirksville College of Osteopathy and Surgery as Dr. Hoyt and an assigned committee are currently exploring relocation of the Rehabilitation Department of the teaching hospital in a proposed Extended Care Facility.

## COORDINATION WITH OTHER PLANNING BODIES

As mentioned earlier the boundaries of the planning areas of the State Plan for Rehabilitation Facilities and Workshops and those of the Comprehensive Statewide Plan for Vocational Rehabilitation Services are coterminous. These planning areas were originally developed by the Office of State and Regional Planning and Community Development. The project director of the State Plan for Rehabilitation Facilities and Workshops is a member of the Policy Committee of the Comprehensive Statewide Plan for Vocational Rehabilitation Services. The "disability" census which is to be done under the guidance of the subcommittee on Research and Statistics of the Comprehensive Statewide Plan should be very useful in determination of the need for rehabilitation facilities and workshops for special disability groups if such a concept proves economically practical.

Although the project director has not been directly involved in either the State Plan for the Construction of Community Mental Health Centers (P.L. 88-164) or the State Plan for Construction of Facilities for the Mentally Retarded (P.L. 88-164), the relationship between the Division of Mental Diseases and the Section of Vocational Rehabilitation has been one of growing enrichment as evidenced by the cooperative establishment of Rehabilitation Units in State Hospital No. 2, 3 and 4 and the evolving Rehabilitation Units at the Marshall School-Hospital and the Western Missouri Mental Health Center. The project director has served as a member of the Manpower Committee of the State Mental Health Planning Committee and is a member of the Liaison Committee

between State agencies formed at the request of Harold Robb, M. D., Associate Director and Chief, Section on Mental Retardation, Division of Mental Diseases.

## SUMMARY

The foregoing constitutes the initial Missouri State Plan for Workshops and Rehabilitation Facilities and will be reviewed, updated and modified annually as experience and new knowledge dictates. In this sense it is a tentative, developing plan subject to periodic change to meet existing needs. The attainment of the global goal of meeting the workshop and rehabilitation facility needs of the citizens of Missouri is dependent upon the interest, motivation, perseverance and finances of the citizens of the State and the Vocational Rehabilitation Administration. This is a worthwhile goal within the grasp of the citizenry and one in which we may be victorious through the coordinated support of those interested in the welfare of the physically and mentally handicapped.

EXHIBIT A

Glossary of terms--Source, Federal Register, Volume 31, No. 9, January 14, 1966, and Federal Register, Volume 32, No. 36, February 22, 1967

"Establishment of a rehabilitation facility" means (1) the expansion, remodeling, or alteration of existing buildings, necessary to adapt or to increase the effectiveness of such buildings for rehabilitation facility purposes; (2) the acquisition of initial equipment for such purposes; or (3) the initial staffing of a rehabilitation facility, for a period not exceeding 1 year.

"Establishment of a workshop" means the expansion, remodeling, or alteration of existing buildings, necessary to adapt such buildings to workshop purposes or to increase the employment opportunities in workshops, and the acquisition of initial equipment necessary for new workshops or to increase the employment opportunities in workshops.

"Job tryouts" means work experiences, within a workshop or rehabilitation facility or in conjunction with outside industry or other community resources, to assist the individual to acquire knowledge and develop skills, and to assess his readiness for job placement or fitness to engage in a specific occupation.

"Maintenance" means payments to cover the handicapped individual's basic living expenses, such as food, shelter, clothing, health maintenance, and other subsistence expenses essential to determination of the individual's rehabilitation potential or to achievement of his vocational rehabilitation objective.

"Nonprofit," when used with respect to a rehabilitation facility or a workshop, means a rehabilitation facility or a workshop, respectively, owned and operated by a corporation or association, no part of the net earnings of which inures, or may lawfully inure, to the benefit of any private shareholder or individual, and the income of which is exempt from taxation under section 501 (c) (3) of the Internal Revenue Code of 1954.

"Physical or mental disability" means a physical or mental condition which materially limits, contributes to limiting or, if not corrected, will probably result in limiting an individual's activities or functioning. It includes behavioral disorders characterized by deviant social behavior or impaired ability to carry out normal relationships with family and community which may result from vocational, educational, cultural, social, environmental, or other factors.

Exhibit A

"Rehabilitation facility" means a facility, operated for the primary purposes of assisting in the rehabilitation of handicapped individuals, (1) which provides one or more of the following types of services: Testing, fitting or training in the use of prosthetic devices, prevocational or conditioning therapy; physical or occupational therapy; adjustment training; evaluation, treatment, or control of special disabilities; or (2) through which is provided an integrated program of medical, psychological, social and vocational evaluation and services, under competent professional supervision: Provided, That the major portion of such evaluation and services is furnished within the facility, and that all medical and related health services are prescribed by, or are under the formal supervision of, persons licensed to practice medicine or surgery in the State.

"State agency" or "State vocational rehabilitation agency" means the sole State agency designated to administer (or supervise local administration of) the State plan for vocational rehabilitation services. The term includes the State agency for the blind, if designated as the sole State agency with respect to that part of the plan relating to the vocational rehabilitation of the blind.

"Substantial handicap to employment" means that a physical or mental disability (in the light of attendant medical, psychological, vocational, educational, cultural, social, or environmental factors) impedes an individual's occupational performance, by preventing his obtaining, retaining, or preparing for a gainful occupation consistent with his capacities and abilities.

"Training in occupational skills" means a planned and systematic sequence of instruction under competent supervision which is designed to impart predetermined skills and knowledge with respect to a specific occupational objective or a job family, and to assist the individual to adjust to a work environment through the development of appropriate patterns of behavior.

"Training services" includes (1) training in occupational skills; (2) related services, including work evaluation, work testing, provision of occupational tools and equipment required by an individual to engage in such training, and job tryouts; and (3) payment of weekly training allowances to individuals receiving such training and related services.

"Work evaluation" means the appraisal of the individual's capacity (1) to adjust to a work environment, (2) to acquire occupational skills, and (3) to attain appropriate vocational goals.

"Workshop" means a place where any manufacture or handiwork is carried on, and which is operated for the primary purpose of providing gainful employment to the severely handicapped (1) as an interim step in the rehabilitation process for those who cannot be readily absorbed in the competitive labor market; or (2) during such time as employment opportunities for them in the competitive labor market do not exist.

Exhibit A

"Work testing" means the utilization of work, simulated or real, to assess the individual's productive, physical, and psychosocial capacity to adapt to a work environment.

EXHIBIT C

BASIC PROVISIONS OF AID TO REHABILITATION FACILITIES AND WORKSHOPS

Section 2--ESTABLISHMENT OF WORKSHOPS AND REHABILITATION FACILITIES

PURPOSE: To assist public and nonprofit agencies to establish workshops and rehabilitation facilities
PROVISIONS: Expansion, alteration, remodeling, equipment, and staffing (facilities only)
MATCHING RATE: 75% Federal--25% Applicant
GRANT PERIOD: Fiscal Year Basis
APPLICATION PROCEDURE: State VR Agency

Section 3--INNOVATION

PURPOSE: To assist State VR agencies to innovate VR services
1. New methods and techniques
2. Special services to severe disabilities
PROVISIONS: Expansion, alteration, remodeling, equipment, and staffing (facilities only)
MATCHING RATE: 90% Federal--10% Applicant--First 3 years
75% Federal--25% Applicant--Last 2 years
APPLICATION PROCEDURE: State VR Agency

Section 4--EXPANSION

PURPOSE: To assist State VR agencies and other public or private nonprofit agencies to increase the number of clients vocationally rehabilitated
1. Expansion and extension of present services
2. Initiation of new services
3. Services to specific disability groups
4. Preparation for and placement into self-employment
PROVISIONS: Staffing, equipment
MATCHING RATE: 90% Federal--10% Applicant--3 years maximum
APPLICATION PROCEDURE: State VR Agency

Section 4--COMPRHENSIVE PLANNING

PURPOSE: To make vocational rehabilitation services available to all handicapped persons by 1975
PROVISIONS: Salaries for staff, consultants, travel costs, supplies, preparation and distribution of plan
MATCHING RATE: 100% Federal--2 years maximum
APPLICATION PROCEDURE: Regional VRA Office

Exhibit C

Section 12--PLANNING GRANTS FOR WORKSHOPS AND REHABILITATION FACILITIES

PURPOSE: To assist State VR agencies in the cost of developing a State workshops and rehabilitation facilities plan and to provide for a continuing program for the establishment, utilization and construction of workshops and rehabilitation facilities
PROVISIONS: Salaries for staff, consultants, travel, expenses advisory committee, preparation of plan
MATCHING RATE: 90% Federal--10% Applicant--1 year plus continuation grants
APPLICATION PROCEDURE: Regional VRA Office

Section 12--PROJECT DEVELOPMENT

PURPOSE: To assist public and nonprofit agencies in the costs of planning and development of specific local construction projects
PROVISIONS: Staff, travel, consultant fees, schematic drawings, preparation of final project report
MATCHING RATE: 90% Federal--10% Applicant
GRANT PERIOD: 1 year
APPLICATION PROCEDURE: State VR Agency

Section 12--CONSTRUCTION

PURPOSE: To assist State and public or nonprofit agencies in new construction of rehabilitation facilities and workshops
PROVISIONS: Purchase of land, architectural fees, new construction, purchase of buildings, remodeling, alteration, renovation, initial equipment, and residential facilities
MATCHING RATE: 50% Federal--50% Applicant--same as Hill-Burton rehabilitation facility projects
GRANT PERIOD: Funds awarded on project basis
APPLICATION PROCEDURE: State VR Agency

Section 12--INITIAL STAFFING

PURPOSE: To assist rehabilitation facilities and workshops in compensation of initial professional and technical staff following construction
PROVISIONS: Salaries for professional and technical staff
MATCHING RATE: 75% Federal--25% Applicant--15 months
60% Federal--40% Applicant--12 months
45% Federal--55% Applicant--12 months
30% Federal--70% Applicant--12 months
51 month maximum
APPLICATION PROCEDURE: State VR Agency

Exhibit C

Section 13--WORKSHOPS IMPROVEMENT

PURPOSE: To assist existing workshops in improving professional services, business management services and all other aspects of their operations
PROVISIONS: Staff, equipment, consultants-professional and business
MATCHING RATE: 90% Federal--10% Applicant--3 years maximum
GRANT PERIOD: 1 year plus continuation grants
APPLICATION PROCEDURE: State VR Agency

Section 13--TECHNICAL ASSISTANCE

PURPOSE: To provide technical assistance and consultant services to public or nonprofit workshops
PROVISIONS: Experts, consultants, panel of experts and consultants
MATCHING RATE: 100% Federal
GRANT PERIOD: Contract Basis
APPLICATION PROCEDURE: State VR Agency

Section 13--TRAINING SERVICES

PURPOSE: To provide training services in facilities or workshops in order to prepare clients for gainful employment
PROVISIONS: Training, occupational skills, evaluation, work testing, occupational tools, equipment, job tryouts--weekly allowances: $25.00 per week. $10.00 per week for each dependent, $65.00 maximum weekly allowance
MATCHING RATE: 90% Federal--10% Applicant
GRANT PERIOD: 2 years
APPLICATION PROCEDURE: State VR Agency

Hill-Burton Act - P.H.S.--HOSPITAL AND MEDICAL FACILITIES CONSTRUCTION-REHABILITATION FACILITIES

PURPOSE: Construction and modernization of rehabilitation facilities
PROVISIONS: New construction, expansion, remodeling, alteration, replacement of existing buildings, equipment
MATCHING RATE: 50% Federal--50% Applicant
GRANT PERIOD: Funds awarded on project basis
APPLICATION PROCEDURE: Hill-Burton State Agency (State Dept. of Health)

## ADDENDUM

## OTHER INFORMATION REQUESTED BY V. R. A.

Facilities Staff--

Project director--Coordinator, Rehabilitation Facilities. This continues to be a one-half time position requiring the services of an experienced Vocational Rehabilitation counselor with a minimum of a master's degree. The functions of the project director are to direct the organized effort of the Section of Vocational Rehabilitation to make a determination from the recommendations of the advisory committee of the state's need for workshops and rehabilitation facilities and to develop with the assistance of auxiliary staff the State Workshop and Rehabilitation Facility Plan. Mr. Robert H. Prouty continues to be the project director.

Other facility staff--One full-time professional staff position is still felt to be necessary to implement the State Workshop and Rehabilitation Facility Plan. This position requires someone experienced in data collection and analysis and having the minimum of a master's degree. Mr. Stuart Zimmerman who served in this capacity during a portion of the current fiscal year has terminated employment with the Section of Vocational Rehabilitation and Mr. Cecil M. Brown, State Supervisor of Rehabilitation Units in State Institutions, has been functioning in this position. Efforts are to be continued for the recruitment of a full-time research analyst.

The facility specialist on the staff of the Bureau for the Blind, Mr. Bernard Preuss, will continue to participate actively in all phases of the plan development. It is planned to employ one full-time experienced secretary for the staff on this project. At this time, it does not appear necessary to have more secretarial assistance.

At the termination of the Continuation Grant request for the State Plan for Workshops and Rehabilitation Facilities in June 1968, those facility staff members funded under Section 12 will be transferred to Section 2 funds. The State Plan will continue to be reviewed annually and modified as indicated.

Advisory Committee--

The members of the Advisory Committee are listed in Exhibit B. The functions listed below of this committee were given to the individual members in writing at the initial meeting. The Advisory Committee:

1. Is to assist and advise the planning staff in the continuing planning program for statewide workshops and rehabilitation facilities.
2. Recommends personnel standards for workshops and rehabilitation facilities staff. A National Policy and Performance Council has been appointed by the Secretary of Health, Education and Welfare and it is anticipated that this council will make personnel standards which will eventually be accepted by all the states. In the interim, the accrediting bodies of the Association of Rehabilitation Centers and the National Association of Sheltered Workshops and Homebound Programs probably offer the best guides.
3. Reviews Inventory Schedules (VRA 31) and Utilization Summaries (VRA 32) together with other significant facts in order to assist the planning staff in the assessment and determination of workshop and rehabilitation facility needs within the State.
4. Recommends to the planning staff specific and imminent areas of need for workshops and rehabilitation facilities within the State to aid in short range planning.

5. Recommends to the planning staff a general overall plan for statewide development of workshops and rehabilitation facilities to promote and advance long range goals for meeting anticipated needs through 1975.

6. Serves as an advisory body in the establishment of a priority system for meeting both short and long range goals as decreed for workshops and rehabilitation facilities (including residential accommodations for the mentally retarded or severely immobilized in conjunction with workshops or rehabilitation facilities) taking into consideration availability of professional staff, efficiency of operation and adequacy of funds.

7. Performs such other activities involving workshops and rehabilitation facilities as may be designated by the Director of Vocational Rehabilitation.

Plans for Coming Year--

The facilities staff for the coming year will be composed of a project director (one-half time), a full-time research analyst and a full-time secretary. Mr. Bernard Preuss, Bureau for the Blind, will continue to participate actively in all phases of the plan development. The position of research analyst is vacant at this time.

No changes in the organization and activities of the advisory committee are contemplated during the 1968 fiscal year. The project staff will continue to work closely with other planning bodies concerned with workshops and rehabilitation facilities. The planning areas will remain intact with some attention being given to multi-area planning.

Data for the inventory and utlization schedule will be gathered again in the Spring of 1968 so that it will be current at the time of writing

the 1968 State Plan. As soon as the State standards are developed for staffing workshops and facilities, an inventory will be initiated of those institutions desiring to sell services to the Section of Vocational Rehabilitation.

As soon after July 1, 1967, as time permits an analysis of utilization of workshops and facilities will be made of individual counselors, rehabiilitation units in state hospitals and district offices. This information will be used in staff conferences with the appropriate units. The planning staff will continue to meet with local community groups interested in development of workshops and rehabilitation facilities in all areas of the State.

Motivation of Domestic Seasonal Farm Workers. Vegetable Crops Series 127.

California Univ., Davis
MF AVAILABLE IN VT-ERIC SET.
Pub Date - 63 12p.

*AGRICULTURAL LABORERS; MIGRANT WORKERS; MOTIVATION; LABOR CONDITIONS; EMPLOYMENT PRACTICES; *EMPLOYEE ATTITUDES; *WORK ENVIRONMENT; *WORK ATTITUDES; SURVEYS
FRESNO COUNTY; CALIFORNIA

Opinions were obtained from 283 farm workers in Fresno County, California regarding the characteristics of a good place to work. Of the 283 workers, 223 were applicants at employment offices. The questionnaire items required the respondent to rank 12 items in order of importance. A preference rating was calculated for each item. Amount of pay was rated most important by local single, migrant single, local family, and migrant family workers. Both migrant single and family men rated housing highly. Length of work day was important. Fairness was given a wide range of importance, but rated fourth overall. The kind of work rated fifth, but was rated low by migrant singles. The sixth rating was given to foreman interest in workers. The length of employment was of moderate importance. Good food, if provided, was of most importance to migrant singles, but eighth in importance to all groups. Workers rated as ninth the factor, "foreman give directions to perform work." Travel distance to and from town was of more importance to local single and family workers, but tenth overall. Incentive pay was not generally understood. Facilites to use spare time were of least importance. There were good correlations between employment office fieldmen and workers' opinions. The questionnaire is included. (JM)

VT005028

# MOTIVATION OF DOMESTIC SEASONAL FARM WORKERS*

John H. MacGillivray

Department of Vegetable Crops, Davis, California

Employees, whether on a farm or in a factory, need some desire or reason, in addition to money, for working effectively. This need is established in the initial work stages and should be recognized and satisfied throughout the employment period. Unfortunately, the employer is not always aware of his employees' motivations. Motivation refers to the needs and desires that push or urge the worker towards certain goals. The grower desires that these goals, when provided, will result in an efficient worker on the ranch. A study of the workers' opinions regarding characteristics of a good place to work should be useful to a grower.

In the fall of 1962, a survey was made in Fresno County, California, to obtain the workers' opinions about job characteristics. Opinions were obtained mostly from workers applying at various farm labor offices. An attempt was made to sample workers in camps and housing areas with limited success. A total of 283 questionnaires were completed with some 223 confined to applicants at the employment offices. These data will be found in the following tables (3 and 4). Studies similar to this one are rare in agriculture but are fairly common in industry.

In making any survey of a large group of people you are always faced with the problem of various degrees of interest in filling out the survey as well as understanding of the terms. In all cases the terms were explained to those filling out the questionnaire. It is difficult to obtain equally accurate opinions from all persons taking part. This is partly due to their educational experiences and the newness of this type of undertaking to them. It seems logical that as agriculture makes progress and workers may change, that slightly different opinions might be expressed five years from now.

## PREVIOUS RELATED STUDIES

There have been a series of similar studies made with industrial and commercial workers (1, 7), but only one agricultural study has been located. The most useable study (6) was made in Ontario, Canada in 1953 and has been reproduced in Table 1. While farming methods may be somewhat different in Eastern Canada the general reactions of workers and farmers are of interest.

---

*This study received the generous cooperation of the California Department of Employment staff in their Fresno office. The interest and suggestions of S. J. Barrick, G. B. Fullenwider, and R. A. Chapman were greatly appreciated.

The study of Mackworth (7) is of interest since much of our harvesting of agricultural crops in California is performed under moderately warm conditions (Fig. 1). The men in this test were doing heavy muscular work under different temperature conditions. Temperatures, both low and high, are important factors affecting worker output. While in most farm operations it is not practical to consider modifying temperature, this factor should be kept in mind since it may have application to some situations. Providing shade for the workers on the canning tomato harvesters is a good application of these principles.

## CALCULATION OF PREFERENCE RATING

Since in none of the twelve characteristics of a good place to work was there unanimous choice, the calculation of a "Preference Rating" was essential. This is a simple arithmetic calculation:

Example--amount of pay for single local worker.

$$\frac{(7 \times 1) + (10 \times 2) + (3 \times 3) + (2 \times 4) + (1 \times 5) + (1 \times 7)}{24} = 2.33$$

Seven persons selected amount of pay as first in importance; ten gave it second choice; three--third choice, et cetera.

Figure 1. The effects of level of motivation, temperature, and ability upon heavy muscular work (Mackworth, 7).

Table 1. How farmers and workers answered the question*--"What are the most important things for a farmer to keep in mind if he intends to hire and keep good help?" (7)

| Order of importance | Farmers | Workers |
|---|---|---|
| 1. | Reasonable and regular hours. | Reasonable and regular hours. |
| 2. | Good food and living quarters. | Good food and living quarters. |
| 3. | Good wages. | Good wages. |
| 4. | Work with men. | Mechanization (labour saving, good repair) |
| 5. | Share undesirable jobs. | Be a successful farmer. |
| 6. | Prompt regular pay. | Get most done with least effort. |
| 7. | Take personal interest in men. | Avoid harsh criticism. |
| 8. | Avoid harsh criticism. | Work with men. |
| 9. | Mechanization (labour saving, good repair) | Definite agreement re wages and employment. |
| 10. | Give men responsibility. | Prompt regular pay. |
| 11. | Time off or vacations. | Plan work with men. |
| 12. | Most done with least effort. | Take personal interest in men. |
| 13. | Plan work with men. | Share undesirable jobs. |
| 14. | Be a successful farmer. | Extra pay for extra work. |
| 15. | Make sure men get to town regularly. | Time off or vacations. |
| 16. | Definite agreement re wages and employment. | Make sure men get to town regularly. |
| 17. | Extra pay for extra work. | Give men responsibility. |
| 18. | Cash bonuses or profit sharing. | Hire men by the year. |
| 19. | Hire men by the year. | Cash bonuses or profit sharing. |
| 20. | Have enough work to hire several men. | Have enough work to hire several men. |

*Lane, S. H. and D. R. Campbell. 1953. How to keep your farm help. Ont. Agr. College, Ont. Dept. of Agr. (Guelph), Cir. 177, 6 pp.

This procedure summarizes these data and not only gives the order of importance of different characteristics, but also the relative spread between job characteristics.

The number of questionnaires filled out was as follows: Local singles--24; migrant singles--41; local family--67; and migrant family--91.

DISCUSSION OF THE DATA

An examination of the data in the tables indicates that in no case was there unanimous agreement as to the importance of different characteristics. However, in preference rating the amount of pay was always first and the facilities to use spare time always in 12th place. A copy of the questionnaire used will be found in Table 2. The detailed data are presented in Table 3 and a summary of these data in Table 4. There were six interviews with persons in camps and eleven with those living near farms in town. These were too limited to be considered other than in the discussion. There was a good correlation between the rating of the twelve characteristics selected by Farm Labor Office fieldmen and the workers interviewed at the offices. The $r$ values were as follows: local singles 0.68; migrant singles 0.72; local families 0.80; and migrant families 0.78. Most of the following discussion will deal with the questionnaires filled out at the Farm Labor Offices, but these other data will be given consideration. In the following discussion the percentage preference has been calculated for three groups as follows:

Rated as 1-4; 5-8; and 9-12, as well as the number selecting the number 1 rating.

1. Amount of Pay. All four types of workers listed in Table 4 indicated that pay was the most important characteristic. A total of 93.3 per cent of the workers rated wages from 1-4. First place for wages was chosen by 49.8 per cent of the workers. Good housing was the next most important consideration for 30 out of 91 persons of migrants with families. It also rated high for local men with families and migrant men without families. In the case of single men in camps 5 rated wages as most important and 1 gave food the first choice. In the case of families living in town near farms all eleven gave wages as the most important item. Field men rated wages very high with all four types of workers, but in the case of migrant men with families housing was rated higher than wages.

The importance of pay to California workers seems more important than other studies in agriculture (Table 1) and industry. A survey made in Ontario, Canada, found both growers and workers rating wages in third place following "reasonable and regular hours" and "good food and living conditions." In industry wages may be rated as low as fifth or seventh place. However, in reasons given for dissatisfaction, usually wages are rated as most important.

2. Housing. This is a characteristic whose importance varies greatly with the worker's social situation. Both migrant men with and without families give a high rating to this factor. In the following percentages the first number indicates the per cent rating this factor

first, and the second percentage those that rated it in the top four: Local men without families 8 and 29%; migrant men without families 24 and 90%; local men with families 15 and 56%; and migrant men with families 33 and 77%. In this characteristic, in all cases, housing was rated from 1 to 12 showing there were other factors affecting their choice. In the Ontario study both "good food" and "living quarters" are second in order of importance. In industrial studies this factor was not applicable.

3. Length of Work Day. This factor considers how important is the number of hours worked per day. It considers primarily whether the employee wishes to work long hours of over ten each day. While this factor is of secondary importance, all groups give a high percentage of choice in the first four ratings. These percentages range from 42 to 53 per cent with migrant men with or without families placing 53 per cent of their choices from 1 to 4. In the Ontario study first rank was given to "reasonable and regular hours." This factor is not covered in industrial studies since workers usually receive better wages for overtime work.

4. Fairness. Fairness refers to honesty and other conditions which make up fairness such as freedom from false accusations and listening to complaints. In all groups of workers this factor was rated fourth in importance twice and fifth twice. Fairness seems to show a wide range of importance. It seems slightly more important with men with families. The top four ratings were selected 30 per cent by the men with families and 20 per cent with those without. Migrant men without families gave the lowest rating of 18 per cent. Close to 55 per cent of all groups chose the ratings of 5-8 in the middle of the table. This factor was not considered in the Ontario study and in industry was rated medium high in one case and unimportant in the other.

5. Kind of Work. Some workers have a strong preference for the type of work they wish to do. Tree harvest versus "stoop labor" makes a difference to some people while others are not concerned. Local men without families placed 58 per cent in the first four ratings. Other employees rated this item in the first four 17-34 per cent of the time. Migrant workers without families gave this characteristic the least importance. In the Ontario study the farmers rated "share undesirable jobs" in fifth place while workers placed it in 13th place.

6. Foreman Takes Interest in Workers. This item covers many conditions that may vary from ranch to ranch. The supervisor shows that the employees are important to the ranch's success, takes some personal interest in men, praises in public, and corrects mistakes in private. Some 24 per cent of the workers rate this characteristic in the top four as to importance. From 5 to 8 it is a common choice. The percentage selected from 5 to 8 are as follows: Local men without families 58%; local men with families 43%; migrant men without families 63%; and migrant men with families 51%.

7. Length of Employment Period-Weeks. This factor refers to whether work lasts for one day, a month, or several months. This condition is rated from 1 to 4 some 25 per cent of the time and 50 per cent from 5 to 8. Workers feel this is of moderate importance.

Migrant men without families gave it the lowest rating. In the Ontario study "hire men by the year" was rated 19th by farmers and 18th by the workers.

8. Good Food, if Provided. There is great variation in the rating of this item, depending upon where the worker lives and whether married or single. Food is an important item to almost all workers. In this survey the migrant single workers rated it higher than any of the other three groups. Some 71 per cent indicated a choice from one to four. Migrant men with families gave this item the lowest rating (20 per cent). Both local men with and without families gave food an intermediate rating. Perhaps local men with families were rating more for good food than a characteristic of employment. Field men rated food much higher for local single men than did the workers. In the Ontario study "good food and living quarters" was rated as the second most important factor.

9. Foreman Gives Directions to Perform Work. While most workers have some knowledge as to how the work should be performed, it is desirable to give some directions or suggestions as to how the foreman wishes the work done. This is more effective than correcting poor workmanship. This characteristic did not rate very high among the workers. All workers place this factor in the 5 to 8 classes 51 per cent of the time. The groups rated it very uniformly with a range of 45 to 58 per cent.

10. Travel Distance to and from Town. The distance of ranch from town could be important to all workers. People living on or near the ranch need supplies and other materials. Workers living in town contribute their travel time twice a day. Most workers rated this item below fourth place. Almost one-half indicated the importance of this factor as from 9 to 12. Some 71 per cent of the migrant men without families rated this item in the 9 to 12 group. Local men with or without families regarded this factor more important than did migrant people. In the Ontario study the factor of "make sure men get to town regularly" is listed 16th place by farmers and workers.

11. Incentive Pay. The workers seemed unfamiliar with this term and it is possible this characteristic was rated lower than was justified. There are three types of incentive pay--piece rate, piece rate with an increase at higher rates of output, and a completion bonus. With all four types of workers about one-half of the choices were from 9 to 12. Migrant men with families and local men without families showed a slightly greater preference for incentive payments.

12. Facilities to use Spare Time. This item deals primarily with men living in ranch camps or families living on the ranch. In camps there may be television sets, radios, or lounging room for single men. For families it could be a play yard for his children. All groups of workers agreed this was the least important of all the characteristics. This factor was rated in rating 9 to 12 from 84 to 90 per cent of the time. The ratings of the fieldmen on this characteristic were in agreement with the workers.

## SUMMARY

This study brings out some definite information. "Pay" was always in first place. Three groups rated "housing" in second place. Three rated "length of work day" in third place, one in fourth place. Three rated "fairness" in fourth and one in fifth place.

Provision to "use spare time" was always listed as lowest in importance. "Foreman's directions" also received a low rating. "Incentive pay" and "Travel distance" were also unimportant items.

CHARACTERISTICS OF A GOOD PLACE TO WORK

There is need to know the characteristics of a good place to work. In order to provide good working conditions, we and the farmer need to be familiar with the worker's desires. To determine YOUR most important desires we are asking for your help to develop this information. Thank you very much.

Type of worker:

1. Seasonal ☐ Casual ☐ Day worker ☐

2. Local ☐ Migrant ☐ Interstate ☐ Intrastate ☐

3. Single person ☐ Person with family ☐

Where is your home? _____

Importance of working conditions:

Mark "1" for item most important to you; mark "2" for the second most important item, and so forth, and mark "12" for the least important item.

Wingspread Conference on Fire Service Administration, Education and Research, Statements of National Significance to the Fire Problem in the United States.

Johnson Foundation, Racine, Wis.
MF AVAILABLE IN VT-ERIC SET.
Pub Date - Feb66 17p.

*CONFERENCES; *RESEARCH NEEDS; *FIRE PROTECTION; ORGANIZATIONAL CHANGE; COMMUNICATION PROBLEMS; PROFESSIONAL RECOGNITION; COMMUNITY RESPONSIBILITY; PUBLIC SUPPORT; EDUCATIONAL NEEDS; *FIRE SERVICE; *ADMINISTRATION

A conference of the Ad Hoc Committee on Fire Service Administration, Education, and Research was held as the first step in trying to isolate and define some of the major fire service problems so that additional research and study could be given to problems with high priority. The fire service as a whole lacks uniform standards of performance, educational achievement, and skill. Many individual fire departments have made progress in technology, tactics and strategy, and administration and organization. However, this progress has been largely dependent upon the caliber of leadership of individual fire chiefs and there is no assurance that the progress will continue or be maintained when there is a change in leadership. Management systems enhancing the coordination of the fire function above local level must be considered. Without this coordination at a national or state level, it is difficult to maintain open lines of communications within the service itself so that improved methods, techniques, and the systematic exchange of information and ideas can be facilitated. Examples of the 12 statements prepared by the Ad Hoc Committee to clarify understanding of the fire problem and the steps to be taken are: (1) Unprecedented demands are being imposed on the fire service by rapid social and technological change, (2) The public is complacent toward the rising trend of life and property loss by fire, (3) Behavior patterns of the public have a direct influence on the fire problems, and (4) The scope, degree and depth of the educational requirements for efficient functioning of the fire service must be examined. Statements of National Significance to the Fire Problem in the United States

## CONTENTS

1. RESPONSIBILITY STATEMENT

2. AD HOC COMMITTEE

3. FOREWORD

4. STATEMENTS

1. Unprecedented demands are being imposed on the fire service by rapid social and technological change.
2. The public is complacent toward the rising trend of life and property by fire.
3. There is a serious lack of communication between the public and the fire service.
4. Behavior patterns of the public have a direct influence on the fire problem.
5. The insurance interest has exerted a strong influence on the organization of the fire service. This dominance seems to be waning. The fire service must provide the leadership in establishing realistic criteria for determining proper levels of fire protection.
6. Professional status begins with education.
7. The scope, degree and depth of the educational requirements for efficient functioning of the fire service must be examined.
8. Increased mobility at the executive level of the fire service will be important to the achievement of professional status.
9. The career development of the fire executive must be systematic and deliberate.
10. Governing bodies and municipal administrators generally do not recognize the need for executive development of the fire officer.
11. Fire service labor and management, municipal officers and administrators must join together if professionalism is to become a reality.
12. The traditional concept that fire protection is strictly a responsibility of local government must be re-examined.

## THE RESPONSIBILITY FOR WINGSPREAD CONFERENCE STATEMENTS OF NATIONAL SIGNIFICANCE TO THE FIRE PROBLEM

This statement has been approved for publication as a statement of the Ad Hoc Committee which gathered at Wingspread and its drafting subcommittee. The individuals who are responsible for this statement are listed on the opposite page. Institutions and associations are included for identification only; the institutions and associations do not share in the responsibility borne by the individuals.

It was mutually agreed by all conference participants that discussions be thoroughly objective in character and that the approach in each subject area be from the standpoint of the general welfare and not from that of any special political association or economic group. The integrity and dedication to a common purpose that prevailed throughout is a gratifying testament to the ability of the fire chief and the educator to enhance their contributions to society.

The statements, discussions and suggestions presented herein are not necessarily endorsed by the Johnson Foundation, their staff or advisers who were most helpful in handling all the conference requirements both efficiently and graciously.

This Ad Hoc Committee offers these statements of national significance as an aid to clearer understanding of the fire problem and of the steps to be taken in achieving the objectives of bringing the national fire problem into sharp focus. The committee is not attempting to pass on any specific pending legislative proposals, programs or methods. Its purpose is to urge careful consideration of the objectives set forth in the statements and of the best means of accomplishing those objectives through administration, education and research.

## FOREWORD

The direct material fire losses in the United States have continued to rise each year. Available records indicate that in 1965 this loss exceeded 1.8 billion dollars.

The life loss from fire has annually exceeded 12,000 men, women and children for the past several years.

Losses of this magnitude would indicate, then, that unfriendly fire is a major social and economic problem.

Basically, the suppression effort is organized and financed as a local government function. The guarding of local government prerogatives makes it extremely difficult to bring into being any organized method for general improvement in any large segment of the fire service. The fire service as a whole lacks uniform standards of performance, educational achievement or skill. Many individual fire departments have made progress in technology, tactics and strategy, administration and organization; however, this progress has been largely dependent on the caliber of leadership of individual fire chiefs, and there is no assurance that this progress will continue or the standards be maintained when there is a change of leadership in a given fire department.

Often this struggle for progress is made under adverse conditions. The economic base of the community may place such heavy demands on the service dollars available for all local government functions that the financing of the fire function simply cannot be afforded at local level.

Management systems enhancing the coordination of the fire function above local level must be considered. Without this coordination at a national or state level, it is difficult to maintain open lines of communication within the service itself so that improved methods, techniques, and the systematic exchange of information and ideas can be facilitated.

This deficiency in the service as a whole has been pointed out in the study made by the Office of Civil Defense titled "National Fire Coordination Study, Phase I Report, 1965."

Hence, we seem to have in the fire service thousands of individual fire department organizations, each trying to cope with the fire problem, uncertain of its responsibility, its jurisdiction and its level of competency to cope with the day-to-day problems that are related to the total fire picture.

This has been recognized by many individuals and many educational institutions and service associations. Some of the individuals who recognized the need for a comprehensive study in the area of fire service administration, education and research formed this Ad Hoc Committee as a first hopeful step in trying to isolate and define some of the major problems, so that additional research and study could be given to problems with a high priority. This committee is especially grateful to the Johnson Foundation for its interest in supporting this study of the fire problem and its relationship to the socio-economic-political community. It is hoped that once these problems are more clearly defined and understood, foundations, government agencies and educational institutions will bring their resources to bear on the issue.

1. *UNPRECEDENTED DEMANDS ARE BEING IMPOSED ON THE FIRE SERVICE BY RAPID SOCIAL AND TECHNOLOGICAL CHANGE.*

The scale of business and government operations today, the complexity of modern technology and organization, and the swift increase in new knowledge, the population explosion, rapid growth of urban communities, need for efficiency and economy on the part of the commercial and industrial community to compete in our private enterprise system, particularly under the pressure of imports of our foreign trade commitments, require that fire executives and administrators be better educated than their predecessors and better prepared to understand and facilitate change.

The mobility of individuals and whole segments of our society brings about societal change and behavioral patterns which pose tremendous problems for the fire service.

The erection of high-rise structures, large undivided commercial and industrial buildings and solid-wall structures in outlying areas, brings to many small, undermanned and ill-equipped fire departments problems of a magnitude never before faced.

The deterioration of central business sections and the transition of older residential areas help to create slums. Certain ethnic groups are affected by environmental change in a way which compounds the fire problems.

Technological changes in manufacturing processes, science, use of chemistry, nuclear energy, etc., are confronting fire departments with problems far greater than they can handle.

This societal and technological change should be thoroughly researched to determine causes and possible relationship to fire service planning needs.

2. *THE PUBLIC IS COMPLACENT TOWARD THE RISING TREND OF LIFE AND PROPERTY LOSS BY FIRE.*

What are acceptable limits? Certainly we have reached the limit insofar as crime is concerned, and it would appear that we are rapidly approaching the limit for traffic deaths.

Society in general in the United States seems to establish tolerable fire loss limits which we are willing to accept. Many fire officials felt that a one billion dollar loss was the maximum. Now we are approaching two billion dollars with apparent apathy. The United States leads the world in number of fires, fire deaths and property loss.

Acceptable loss limits are attributable in part to public attitude. For example, the person who has a fire in the United States is approximately described by Wainwright: 1

---

1 Wainwright, L. *The View From Here,* Life Magazine, Vol. 60, No. 6, Feb. 11, 1966.

*In the next two days, numb with shock and relief, protected by the fast sympathy and affection of friends and neighbors, we did not think too much about the loss. A friend's sweater fit almost as well as my own, and my younger daughter's bicycle and menagerie of stuffed animals were magically replaced. The fact of insurance coverage insulated us still further.*

This is in contrast to the attitude in other parts of the world toward the individual who has a fire. For example, in some European countries it is against the law to have a fire. In some countries when a person has a fire, he is placed in jail and is guilty until proven innocent.

Industrial concerns have found, many times, that when a new process is developed, it is more economical to build a new building to house the new process than to modify an existing building to accommodate the new process for production efficiency. Therefore, this gives rise to a situation in which buildings are built for a single use and for a single generation rather than for long-term use.

Our system of fire protection and our insurance coverage are definite factors in this complacent attitude. The attitudes of "Why worry, I'm insured" or "The fire department will take care of it" are quite common.

The impact of these attitudes should be studied to determine cause and effect on the total fire loss problem.

### 3. *THERE IS A SERIOUS LACK OF COMMUNICATION BETWEEN THE PUBLIC AND THE FIRE SERVICE*

The individual citizen's understanding of what constitutes fire protection seems to be very limited. This lack of understanding is also shared by those persons primarily responsible for protecting the public welfare, the elected and appointed governmental administrators.

When changing geographic locations, the average person, business or industry researches the availability of community services such as education, recreation, health and welfare, but seldom evaluates the fire protection function, assuming "it is there"!

The fire service itself seems to be hesitant to go much farther in explaining its function than to indicate "We save life and property." A thorough analysis of the men, money and material which go into the achievement of such a noble goal needs to be carefully analyzed by the fire service, and ways and means devised to communicate the objectives of the service for the protection of life and property in the community.

Most citizens judge the fire service by one or two contacts they have had with individual members of the service. If this contact has

been positive, the image of the service is positive to that individual. If the contact has been negative, the picture of the entire service is negative.

A continuing public relations program designed to project the desired image needs to be devised and implemented to improve the picture of the fire service.

### 4. *BEHAVIOR PATTERNS OF THE PUBLIC HAVE A DIRECT INFLUENCE ON THE FIRE PROBLEM.*

Fire frequency has been directly related to human activity. This is reflected in timetables as to when the highest frequency rate occurs during each 24-hour period.

There are many striking examples throughout the United States of times when people knew that protection was not available to them for reasons such as isolation by flood, snowstorm, ice conditions, etc., and the frequency rate has been practically nil. This seems to be related to the fact that if the public is aware that a service does exist, there are psychological reasons why they become careless in relation to fire problems because they seem to feel that they have the backstop of the service to fall back on.

This is also related to the social problem when segments of our society are moved out of their environment and moved into another environment much more susceptible to problems related to fire.

Frequency rate does not seem to be related to type of construction used in this country. Tokyo, which has long been referred to as a paper city, does not have the frequency rate we have. Other examples: In Cairo, Egypt, the incidence of fire was 3,200 in 1965 and in Chicago, 85,000. The population of the two is approximately the same.

Possibly some research is indicated to determine if the loss in groups which have small material possessions, but have no insurance, is very different from the groups which are financially secure and protected by insurance.

### 5. *THE INSURANCE INTEREST HAS EXERTED A STRONG INFLUENCE ON THE ORGANIZATION OF THE FIRE SERVICE. THIS DOMINANCE SEEMS TO BE WANING. THE FIRE SERVICE MUST PROVIDE THE LEADERSHIP IN ESTABLISHING REALISTIC CRITERIA FOR DETERMINING PROPER LEVELS OF FIRE PROTECTION.*

The original concept of organizing public fire protection in this country was to minimize the conflagration hazard. This was originally initiated by the Mutual Assistance concept where all would share in any individual's loss. As a result of this, the criteria for determining

the required levels of fire protection have seemed to be in the direction of establishing fire protection levels to meet insurance requirements.

As a result of many factors such as municipal planning, building construction codes, advanced technology, etc., the same type of conflagration hazard does not exist in cities of the United States today that existed, for example, at the turn of the century.

It can be stated that insurance industry interests have, in fact, solicited the assistance and cooperation of fire officials in the establishment of criteria and standards through the process of committees, associations, etc. However, due to the limitations placed on fire officials by local fiscal problems, the fire official, many times, has not been a member of a committee which formulates these criteria and standards for determining the level for fire protection.

Municipal officials look to their fire officials for this type of technical guidance. The fire official then often finds himself in the peculiar position of trying to apply standards and criteria which he may not understand and which have been virtually handed to him by insurance and industry-oriented interests. This has led many fire officials to use as justification for their request at local level, the statement "This is what the Rating Bureau or the National Board of Fire Underwriters (American Insurance Association) requires."

This has led municipal administrators and governing bodies who are hardpressed to spread the available service dollars over the entire area of municipal services to seriously question the fire official for further justification of his requests for large expenditures of tax dollars.

There is no medium existing in the United States today through which fire officials can take a realistic look at the problems related to determining adequate fire protection requirements.

Since fire protection in this country has been limited to local government jurisdiction, this also inhibits uniformity of fire protection levels as far as equipment and manpower are concerned, as well as forming blocks on determining knowledge and skill levels of individual members of the fire service.

Many times the efficiency level of an individual fire department is entirely dependent upon the leadership and the progressive abilities of the individual fire chief, and there is no assurance that this level of efficiency will be continued by his successor when he retires or leaves the position of fire chief.

If the fire problem is a social problem, then there is a need for new channels of communication opened from the national level to the state level, to the county level, and to the local level. This vehicle or channel of communication does not now exist in the fire service in the United States. Therefore, the efficiency level of personnel, the equipment, codes and all items related to control and suppression activities are left pretty much in the hands of the local community.

There has been considerable evidence in recent years of a gradual withdrawal of ancillary services by the fire insurance industry; so

much so, that the operational fire service would do well to prepare now for complete cessation of these activities.

The insurance companies are businesses. Their primary obligation is to conduct their business in a manner that is satisfactory to their policyholders and profitable to their stockholders. They are not obligated to improve municipal fire protection. This is a public responsibility, through government. Public officials must recognize that adequate protection of lives and property is their obligation.

The operational fire service must have the maturity, professional approach and capability to establish its own standards and to keep them current. Public officials must become willing to accept criteria that are realistic and based on life and property protection without depending upon insurance rates as the primary guide.

This whole area of evaluating today's fire protection requirements needs to be studied in light of the many changes that are taking place in our whole way of life in the United States.

6. *PROFESSIONAL STATUS BEGINS WITH EDUCATION. THE GORDON-HOWELL REPORT SUGGESTS FOUR CRITERIA FOR DEFINING A "PROFESSION"2.*

1. A profession should rest on a systematic body of knowledge of substantial intellectual content and on the development of personal skill in the application of this knowledge to specific cases.
2. It must set up standards of professional conduct which take precedence over the goal of personal gain.
3. It should have an association of members, among whose functions are the enforcement of standards, and the advancement and dissemination of knowledge.
4. It should prescribe ways—controlled in some degree by the members of the professional association—of entering the profession by meeting certain minimum standards of training and competence.

A systematic and deliberate educational program leading to a broad knowledge base which is acceptable to the academic community is the surest approach to professionalization.

It is unrealistic to assume that every member of a fire department has a formal education (college degree).

Therefore, levels need to be established within the profession.

The following charts suggest a method of determining what these levels might be and the source of education and training to meet the desired need.

---

2 SILK, Leonard S. *The Education of Businessmen,* Committee for Economic Development No. 11, p. 9, New York. 1960.

A MEANS OF ACHIEVING PROFESSIONAL EDUCATION

Formal education achievement should help a person acquire a considered sense of values that will give direction, meaning and integrity to his life and his work. He will need certain basic abilities and skills that are widely transferable and needed in nearly every walk of life, including:

- Mastery of the scientific method—that is, the process of objectively seeing and solving problems.
- An understanding of human relations.
- Skill at communicating—in speech and writing.
- An ability to organize limited resources to achieve set goals and objectives.
- An ability to concentrate and apply himself wholeheartedly to the job at hand until it is completed.
- An open and flexible mind that, nevertheless, has a foundation of fundamental convictions and principles.
- An ability to keep on learning on and off the job.

A fire executive is likely to achieve more if he also finds zest, satisfaction and sense of fulfillment in the exercise of his abilities.

7. *THE SCOPE, DEGREE AND DEPTH OF THE EDUCATIONAL REQUIREMENTS FOR EFFICIENT FUNCTIONING OF THE FIRE SERVICE MUST BE EXAMINED.*

Many individual fire departments do have specific educational and skill requirements which must be met by existing fire service personnel.

Virtually all crafts, vocations, technical areas and professions have established minimum in-service training requirements. Specific educational requirements are achieved or internships completed before they are allowed to practice in their field.

Today, craftmen serve as apprentices, being required to have approximately 8,000 shop hours and 760 related hours before they can become journeymen. The technician occupational fields have seen a rapidly expanding technical institute program, leading to the associate degree. These graduates are the highly skilled technicians who complement many of the professional activities.

Each of the true professions has very rigid educational criteria to be met before one can enter the profession. 3

Although efforts are being made in the fire service in several sections of the country to follow such guidelines, at present no uniform criterion is established for the individual or the service as a whole to determine the degree of competency expected of the fire service.

To date, we have approached this problem from one extreme of minimal education, to the other end of the continuum requiring a college degree. An investigation must be made to determine what the educational needs are at various organizational levels.

This whole area needs to be thoroughly studied to arrive at acceptable knowledge and skill requirements to be met by fire service people to achieve the craftsman level, the technician or specialist level and the executive level.

8. *INCREASED MOBILITY AT THE EXECUTIVE LEVEL OF THE FIRE SERVICE WILL BE IMPORTANT TO THE ACHIEVEMENT OF PROFESSIONAL STATUS.*

Mobility is present within virtually all fields of endeavor. In the fire service, many restrictions have been established which limit mobility. Some of these archaic restrictions are individual state pension programs and individual residential requirements. Others have been devised by local and state groups which limit mobility in any level in the fire service.

If uniform knowledge and skill criteria were established on a nationwide basis, there should be no reason why mobility at the various levels in the fire service could not be facilitated.

Professionalism and mobility go together. The parochial attitude that all advancement must come from within the department stifles many competent persons and precipitates incompetency. In many respects the service may be admitting that educational standards for

---

3 SILK, Leonard S. *The Education of Businessmen,* Committee for Economic Development, No. 11, p. 9, New York. 1960.

fire officers are lacking and implying that service with a particular department is the only way to career advancement.

Some states have achieved a degree of mobility for executive and specialist levels in the fire service. However, a comprehensive study needs to be made to determine specific ways in which increased mobility can be attained within the fire service.

9. *THE CAREER DEVELOPMENT OF THE FIRE EXECUTIVE MUST BE SYSTEMATIC AND DELIBERATE.*

As in any other professional field or quasi-professional field, the requirements for the fire executive must be identified. Once this is accomplished, ways and means of individuals to meet the needs and requirements should be established.

This gives rise to the thought of direct entry into the executive level of the fire service as well as coming up through the ranks of the service. Traditionally, in the fire service in this country, we have promoted men into higher ranks or higher levels and then attempted to train and educate the individual to meet requirements of the level to which he has been promoted. This is contrary to the practice in virtually all other professions and technical areas.

The hit-or-miss approach which assumes that $x$ number of years experience is the criterion for advancement *cannot* meet the needs of today, much less tomorrow. Some ways must be found to identify those individuals with potential and develop them for future responsibility, providing a comprehensive program of career development.

Once a systematic and deliberate course of action is established for development of the fire executive, programs need to be established in educational institutions for in-service training of executives as well as those who are interested in entering the field of fire service management to acquire a wide frame of reference.

10. *GOVERNING BODIES AND MUNICIPAL ADMINISTRATORS GENERALLY DO NOT RECOGNIZE THE NEED FOR EXECUTIVE DEVELOPMENT OF THE FIRE OFFICER.*

The fiscally hard-pressed governing bodies and municipal administrators find it difficult to justify sending their fire executives to educational courses for long periods of time. This, it is felt, is partly due to recognition of the fact that there are no specific achievement levels established in many of these courses and activities. It is felt that if various achievement levels or acceptable ends could be shown to governing bodies and municipal administrators, these groups would be more receptive to allowing fire executives to participate.

The full scope and extent of the fire problem often is not understood by governing bodies and municipal administrators because membership in governing bodies is generally transitory. The office holder generally is not in the same office for a long enough period of time for him to understand the full depth and scope of fire service organization, operation, etc. Therefore, he must rely primarily upon his fire executives to justify their participation in educational and improvement activities. The fire executive then finds himself in a position without standards, without specific acceptable development programs, hard pressed to justify to governing bodies and municipal administrators why his fire service people need to participate in extended educational activities.

Executive development programs will not be possible until the people responsible for policy and decisions recognize, pay for and support the development process. Increasing economic and sociological problems justify the immediate need for more competent executive fire service officers.

Lawrence A. Appley, president of the American Management Association, made the following statement during an interview for the New York Times:

"We are entering the worst leadership crisis this country has ever seen in all spheres.

"The fantastic growth of our economy and the needs of our rapidly expanding population, mean that in 25 years management jobs will have quadrupled.

"The depression years deprived many executives now in their 50's from getting proper training and the heavy casualties of World War II drastically cut off a large pool of potential managers.

"If you want someone to perform a task for you, you must place into his mind a clear image of what you want him to do. We must develop people so they will use their potential in full, whether in character, personality or productivity.

"An organization should be run as a football team where everybody knows what he is supposed to do. As for the coach, leadership requires followship but you cannot order it; you must win it."4

11. *FIRE SERVICE LABOR AND MANAGEMENT, MUNICIPAL OFFICERS AND ADMINISTRATORS MUST JOIN TOGETHER IF PROFESSIONALISM IS TO BECOME A REALITY.*

If professionalization within the fire service is to be achieved, then professionalization must be made a common goal toward which all fire service organizations, municipal officers associations and professional management associations can work.

---

4 New York Times, Sunday, Feb. 27, 1966.

All must recognize that professional status begins with education. There is growing evidence of the emergence of a systematic body of a knowledge which can be applied to fire science and administration.

Without this close cooperation and coordination in the development of such a body of knowledge, acceptance of the fire service as a profession will be slow and difficult.

If professionalization is to be achieved, studies need to be made as to ways and means for coordination, and communication channels need to be devised and kept open, so that all organizations which have an interest in the fire problem can work toward a common goal of professionalization of the fire service.

## 12. *THE TRADITIONAL CONCEPT THAT FIRE PROTECTION IS STRICTLY A RESPONSIBILITY OF LOCAL GOVERNMENT MUST BE RE-EXAMINED.*

A principle of fire protection which many fire departments and governmental jurisdictions have had to learn the hard way is stated as follows:

"It is economically unfeasible for any single governmental jurisdiction to equip and man itself with sufficient forces to cope with the maximum situation with which it may be faced." The lack of understanding of this principle has caused many communities to be caught short of fire suppression resources. As a result, catastrophes have not been minimized as fully as possible.

Many local governmental jurisdictions find themselves, in too many cases, too small to be large and too large to be small. As a result, individual communities cannot do some of the things which can be done if the economic base for the service involved is enlarged.

In many governmental service areas, we have seen the expansion of or consolidation of jurisdictions. Good examples of this are school consolidations, sanitary sewer consolidations, water distribution over intra-jurisdictional areas, central purchasing, police protection and, in some instances, fire protection.

Examples of this type of broadening of the economic base to provide adequate fire protection services are found in England. Prior to World War II, there were approximately 15,000 independent fire jurisdictions. During World War II, because of conditions which made it necessary, the fire service was nationalized and became a fourth arm of national defense upon which survival was greatly dependent.

In the denationalization of the British Fire Service in the late 40's, they did not return to 15,000 independent fire jurisdictions, but rather went back to approximately 150 fire jurisdictions. It has been commonly agreed by many fire officials that this method has improved the services and efficiency of the fire service in this situation.

Taking one state as a typical example, the state of Iowa has 940 organized fire jurisdictions. There are 99 counties in the state,

with a total area of 52,290 square miles and a total population of 2,822,000.

By contrast, England has 50,874 square miles with a population of 42,000,000 and now has approximately 150 fire jurisdictions.

Many of these individual fire jurisdictions find themselves unable to cope with the financial burden of providing fire protection as a service. The economic stresses and strains become very pronounced as increased demands for other governmental services occur.

We have seen the trend in certain sections of the country, of the metropolitan concept of merging a city with several of its satellite communities.

A thorough cost analysis study needs to be made to determine if fire protection, as a responsibility of local government, is economically feasible.

# FURNISHINGS, EQUIPMENT & SUPPLIES FOR CHILD DEVELOPMENT LABORATORY IN OCCUPATIONAL HOME ECONOMICS

In order to make initial plans for a child development laboratory for occupational Home Economics, the following list of equipment and supplies is presented. This is a suggested list and substitutions and additions may be made to fit the teaching situation in any given location and program. It is possible that many of these items may be made locally.

| ITEM | RECOMMENDED NUMBER FOR 20 CHILDREN | COMMENTS |
|---|---|---|
| **FURNISHINGS** | | |
| TEACHERS DESK WITH MATCHING CHAIR (To harmonize with tables.) | 1 | |
| TABLES (Light in weight, with laminated finish.) Tables available with adjustable height 21" - 30". | To be determined by number enrolled in course. | |
| CHAIRS, Seat height 17". (Conducive to good posture, sturdy but light weight, finish to harmonize with tables. Folding chairs not recommended.) | To be determined by number enrolled in course. | |
| TABLES - 1 sq. ft. minimum per child with washable tops. 18" ht. for 3 year olds. 20" - 22" ht. for 4 and 5 year olds. Rectangular in shape for art work. | 4 | |
| ROUND TABLES for use in library and doll corner. | 2 | |
| CHAIRS - 10" from seat to floor for 3 year olds. 12" - 14" for 4 and 5 year olds. 14" for teachers. (If space is at a minimum, stack chairs and tables allow space for cots or mats at nap-time.) | 20 | |
| MOVABLE ROOM DIVIDERS OR SCREENS - 36" x 48" (on 14" base) to separate quiet and acitve play areas. | 2 | |

| ITEM | RECOMMENDED NUMBER FOR 20 CHILDREN | COMMENTS |
|---|---|---|
| COTS OR MATS SIZED IN ACCORDANCE WITH AGE OF CHILDREN | 20 | |
| STORAGE SPACE - For each playroom. Open shelves in sections, movable and with backs, for play materials - not over 26" high 12" deep, 12" between shelves, approximately 1 ft. per child. One shelf area 18" wide to accommodate 18" x 24" newsprint. | 4 | |
| BOOK CASE - With slanted shelves to allow front of books to be seen by children. | 1 | |
| LOCKERS - One for each child with hooks and shelves for storage of hats, boots, coats, etc. 12" wide, 12" deep, 9" hat space. 32" to 36" minimum coat space, 9" shoe space. | 5 sets (4 lockers per set) | |
| BULLETIN BOARDS - At eye level for children. Large enough for pictures and children's paintings. (4' x 8'). One in hall or near entrance for parents and students. | 2 | |
| SINK - For water play, drinking, painting 24" to 26" high. Located in playroom for easy supervision. | 1 | |
| WASTE BASKETS | 2 - 4 | |
| HAMPER | 1 | |
| CLOCK | 1 | |
| FIRE EXTINGUISHER(S) (Local regulations) | 1 | |
| FIRST AID KIT | 1 | |
| MIRRORS OVER WASH BASINS IN BATHROOM | | |
| FOOD PREPARATION EQUIPMENT | | |
| AUTOMATIC WASHER (Access to) | 1 | |
| AUTOMATIC DRYER (Access to) | 1 | |
| RANGE - Electric or Gas | 1 | |

| ITEM | RECOMMENDED NUMBER FOR 20 CHILDREN | COMMENTS |
|---|---|---|
| REFRIGERATOR-FREEZER COMBINATION OR ONE REFRIGERATOR AND ONE FREEZER (10 to 16 cubic feet, frost free. Upright freezer preferred.) | 1 | |
| DISHWASHER | 1 | |
| GARBAGE DISPOSAL (If sewage system permits) | | |
| ELECTRIC GRILL | 1 | |
| ELECTRIC CAN OPENER (May be in combination with knife sharpener.) | 1 | |
| ELECTRIC SLICING KNIFE | 1 | |
| ELECTRIC MIXER (Standard) | 1 | |
| ELECTRIC BLENDER | 1 | |
| MUFFIN PAN, 6 - 8 medium size cups (Heavy aluminum or Teflon coated.) | 5 | |
| LOAF PAN, 9" x 5¼" (aluminum or pyrex) | 2 | |
| BAKING DISH (pyrex) 9" x 13½" | 2 | |
| CASSEROLE, 1¼ qt. | 4 | |
| PRESSURE SAUCE PAN (4-quart size) | 2 | |
| FOOD CHOPPER (may be attached to mixer) | 1 | |
| ONION CHOPPER | 1 | |
| COMBINATION COOKER, bottom 3 qt., insert pan 2 qt. (heavy aluminum or stainless steel) | 2 | |
| SAUCE PAN, 4 qt. (Heavy aluminum or stainless steel) | 2 | |
| SAUCE PAN, 6 qt. (Heavy aluminum or stainless steel) | 2 | |
| SKILLET WITH COVER, 8" - 10" (cast iron or heavy aluminum) | 2 | |
| COOKIE SHEET, 14" x 17" (aluminum, with or without Teflon finish) | 3 | |

| ITEM | RECOMMENDED NUMBER FOR 20 CHILDREN | COMMENTS |
|---|---|---|
| CUSTARD CUPS (set of 4) | 5 sets | |
| BAKE AND ROAST PAN (17¼" x 11 3/8" x 2½") | 2 | |
| SIEVE, 5" (strainer type, reinforced) | 1 | |
| COLANDER | 1 | |
| GRATER (four-sided or four sides in separate sections) | 1 | |
| REAMER | 1 | |
| ROTARY EGG BEATER (stainless steel blades, durable) | 1 | |
| CAN OPENER | 1 | |
| ROLLING PIN, 10" | 1 | |
| BISCUIT CUTTER, 2" | 1 | |
| PASTRY BLENDER | 1 | |
| SHEARS (Kitchen) | 1 | |

Equipment for Quantity Food Preparation and Service Laboratory in Occupational Home Economics.

Alabama State Dept. of Education, Montgomery. Home Economics Education
MF AVAILABLE IN VT-ERIC SET.
Pub Date - 65 22p.

*LABORATORY EQUIPMENT; *FOODS INSTRUCTION; *EQUIPMENT STANDARDS; CLASSROOM EQUIPMENT; *FOOD SERVICE OCCUPATIONS; *OCCUPATIONAL HOME ECONOMICS

Minimum equipment needed for quantity food preparation to serve 100 persons at one meal is listed. The information might be useful for planning purchases of equipment to be used in the occupational or general home economics food service laboratories or to evaluate other facilities available in the school or community. Items are listed according to (1) large cooking and baking equipment, (2) sinks and work tables, (3) refrigeration, (4) dishwashing equipment, (5) mobile equipment, (6) serving equipment, (7) small equipment, (8) storage and cleaning, (9) laundry equipment, (10) first aid and fire prevention, (11) appliances, (12) classroom furnishings, and (13) audio-visual aids. Specific items, listed in chart form, include descriptions of specifications and recommended amount or number. An index is included. (FP)

# EQUIPMENT FOR QUANTITY FOOD PREPARATION AND SERVICE LABORATORY IN OCCUPATIONAL HOME ECONOMICS

This list was planned as the minimum amount of equipment needed for quantity food preparation when approximately 100 people are to be served for one meal. This equipment might be purchased and used in a Home Economics Food Service laboratory, or this list might be used to evaluate other facilities available in the school or community, which might be used for occupational experiences of students enrolled in Occupational Home Economics classes in Quantity Food Preparation and Service. The items have been listed in the following catagories:

| | Page |
|---|---|
| LARGE COOKING AND BAKING EQUIPMENT | 1 |
| SINKS AND WORK TABLES | 5 |
| REFRIGERATION | 6 |
| DISHWASHING EQUIPMENT | 7 |
| MOBILE EQUIPMENT | 8 |
| SERVING EQUIPMENT | 8 |
| SMALL EQUIPMENT | 11 |
| STORAGE AND CLEANING | 17 |
| LAUNDRY EQUIPMENT | 17 |
| FIRST AID AND FIRE PREVENTION | 17 |
| APPLIANCES | 16 |
| CLASSROOM FURNISHINGS | 18 |
| AUDIO VISUAL AIDS | 19 |
| INDEX | 20 |

| ITEMS AND SPECIFICATIONS | RECOMMENDED AMOUNT OF EQUIPMENT | COMMENTS |
|---|---|---|
| **Large Cooking and Baking Equipment** | | |
| COMPARTMENT STEAMER: Provide 2 or 3 compartments, 5# pressure steam cooker with steam either supplied by gas or electricity. Cooking compartments should be solid stainless steel with the exterior either enamel or stainless steel. Top cooking compartment equipped with 3 pull out shelves and 6, 12" x 20" x 2½" perforated or solid 20 gauge stainless steel cafeteria pans. All other compartments should be equipped with 2 pull out shelves - 4, 12" x 20" x 4" solid or perforated, 20 gauge stainless steel cafeteria pans. Mark-seal doors shall have dual pressure stabilizing bar and self sealed chevron gasket held in place with a stainless steel plate and screws. It should have door screw turns, acme type, | 1 | |

| ITEMS AND SPECIFICATIONS | RECOMMENDED AMOUNT OF EQUIPMENT | COMMENTS |
|---|---|---|
| Compartment Steamer (Cont'd)<br><br>and replaceable bronze bushings. Timing of cooking compartment shall be by manual mechanical timer mounted in each compartment door. Optional: Steamer could be equipped with fully automatic timer.<br><br>Gas Fired - Tubeless ASME 5 lbs. per sq. inch. Boiler with cast iron burners located in cabinet base equipped for operation with natural or propane gas.<br><br>Electrically operated - KW ASME, 5 lbs. per sq. inch. Boiler located in cabinet base equipped for operation with 110, 220, 240 volt - 60 cycle 3 phase electricity. Entire unit is CSA and UL approved. | | |
| CONVECTION OVEN: Outside dimensions should be approximately 45" wide x 42" deep. Interior shall be stainless steel and 27" wide x 27" deep x 25" high. Oven shelves, shelf supports and stainless steel drip pans shall be removable for cleaning. Shelf supports shall provide 11 positions on 2" centers. Exterior of oven should be stainless steel or hammertone gray sides with stainless steel front. Controls shall consist of thermostat, main switch with signal light, interior light switch, convector fan switch which may be set to automatically turn on fan when doors are opened, and turn off fan when doors are opened. A 60 minute timer and a 5 hour timer both with a bell alarm should be included. Oven shall be furnished with 6 removable shelves, but oven should be able to hold 11 shelves. Unit shall be complete and furnished with open stand or cabinet base. Oven shall bear the AGA, NSF, and UL seals of approval.<br><br>Gas - Control with safety pilot electrically energized. Oven shall be equipped with 6 stainless steel burners designed to use with natural or propane gas, and shall be rated at 9,500 BTU.<br><br>Electric - Oven shall be supplied with electric heating elements with total load of 15.3 KW. | 1 | |

| ITEMS AND SPECIFICATIONS | RECOMMENDED AMOUNT OF EQUIPMENT | COMMENTS |
|---|---|---|
| DEEP FAT FRYER: (Gas or Electric)<br><br>Gas Deep Fat Fryer - 120,000 BTU. Fryer should be equipped with a 15" wide x 14" deep stainless steel fry pot. Unit shall be standardly furnished with 2 fry baskets. Front and ends shall be finished in dark gray enamel. Unit shall be supported on 9" adjustable legs. Also to be equipped with a Robert Shaw self-generating electric snap-action thermostat.<br><br>Electric Deep Fat Fryer - 20" x 36" deep total wattage load 12 KW. Units should be equipped with a lift out fat container. Also to be furnished with Robert Shaw snap-action thermostat and red signal light power indicator. Top of unit to be constructed of chrome plated steel. Standard stainless steel front and ends shall be finished with hammertone gray enamel. Mounted on 6" adjustable legs. | 1 | |
| FLOUR & SUGAR CONTAINERS: Portable stainless steel bins approximately 22" long x 17" wide with a capacity of holding 150 lbs. Corners should be rounded and coved. The bin should be mounted on 4 rubber tired, swivel type, heavy duty ball bearing casters. Bin shall be equipped with a heavy duty rubber bumper on all 4 sides. The top shall be equipped with a stainless steel one piece cover. | 2 | |
| HOOD AND FAN: Construction shall be of galvanized finish hammertone gray enamel. Hood shall extend over all sides of cooking surfaces approximately 10". Hood shall have a double V typed continuous filter bank equipped with filters which have a capacity of adequately removing grease from air at 800 CFM per filter. Hood shall be equipped with removable grease gutter under filter bank to be provided with a 3" grease gutter with drain plugs around all sides. Hood shall hang approximately 7'0" from floor. Provide exhaust fan for adequately removing 800 CFM per filter. | 1 | |
| MIXER: A-200 bench model Hobart mixer or its equivalent with standard attachments, plus dough hook, and the following items: | 1 | |
| Stainless steel 20 quart bowl | 1 | |
| Stainless steel 12 quart bowl | 1 | |

| ITEMS AND SPECIFICATIONS | RECOMMENDED AMOUNT OF EQUIPMENT | COMMENTS |
|---|---|---|
| Mixer (Cont'd) | | |
| 20 quart bowl adaptor | 1 | |
| Batter beater - (12 qt. size and 20 qt. size) | 2 | |
| Wire whip - (12 qt. size and 20 qt. size) | 2 | |
| Dough Hook - (12 qt. size and 20 qt. size) | 2 | |
| MIXER STAND: Size - 24" x 28" x 26". Top 14 gauge stainless steel of seamless construction. All edges should be rolled with a two inch radius and all covers bull nosed. Top should be brased by heavy gauge angle iron frame. The under shelf should be 14 gauge stainless steel with all edges formed into a 2 inch cone shape and should be notched to tightly fit contour of legs and welded at all contact points. Legs should be stainless steel pipe with an outside diameter of 1 5/8 inches. One rear leg should stand to an overall height of 70" with the top enclosed. This particular rack should be fitted with 5 pegs with 7/16" stainless steel rod. The pegs should be 6" long and turned upward 2" and welded. The lowest peg should be approximately 30" above the top of the stand. Other pegs may be spaced on 3" centers and staggered with three pegs facing front and 2 pegs facing inward at a 45 degree angle. The unit should be mounted upon heavy duty 5" double barrel or cadmium plated swivel casters - two with brakes. Caddy Model T-242 or its equivalent. | 1 | |
| PEELER, VEGETABLE: Portable Hobart Peeler and stand - Model 6115 or its equivalent including peel trap basket. | 1 | |
| PROOF BOX AND HOT CABINET, PORTABLE: Size shall be approximately 21 inches wide by 31 inches deep by 70" high. Should have pan capacity of 18" x 26" bun pans. Should be equipped with 115 volt tubular rod-type heating element with humidity unit, thermostat timer, amd pilot indicator light. Should be constructed of all aluminum and furnished with heavy-duty, neoprene casters. | 1 | |
| RANGE, HOT TOP, GRIDDLE: Heavy-duty commercial type, insulated ovens with automatic heat controls and removable racks. Cooking surface should consist of solid top or oven burners or a combination of the two. Range section - 34" to 36" wide, 36" to 42" front to back, 36" high when mounted on legs or masonry base. Actual cooking surface 5 to 6 sq. feet. Griddle top should be thermostatically controlled. | 1 | |

| ITEMS AND SPECIFICATIONS | RECOMMENDED AMOUNT OF EQUIPMENT | COMMENTS |
|---|---|---|
| SLICER: Hobart slicer #410 or its equivalent. | 1 | |
| STACK OVEN: To be used for roasting and baking. Two decks, 2 pans per deck and should have separate sections. One deck should be 7" for baking and one 12" for roasting. Automatic temperature controls should be at each deck level. Overall size, approximately 60" x 40". | 1 (Optional) | |
| STEAM-JACKETED KETTLE: Size shall be 20, 30, 40 gallons depending on the need.<br><br>Gas - Interior shall be polished to a 200 emory grit finish. Exterior to be a bright semi-deluxe finish insuring maximum ease in cleaning and a constant brilliant appearance. Shall be durable and constructed in a 1 piece welded unit. Unit shall be provided with a tangent type draw off line complete with a nickel alloy metal faucet. Should include compression disk type drain; valve should be sanitary type readily dismanteled without use of tools.<br><br>Cover: Units up to 40 gallons capacity shall be fitted with one piece hinged dome cover.<br><br>Sanitation: This unit shall be strictly sanitary and comply with NSF standard #3.<br><br>Control panel: Control housing shall contain a safety pilot mechanism, water gauge, glass and pressure gauge.<br><br>Installation: Standard gas or electric connections required with water connections. Unit should be connected ready to operate. | 1 | |
| **SINK AND WORK TABLES** | | |
| LAVATORY, HANDWASHING: Stainless steel or acid-resisting procelain enamel on cast iron sink with mixing facet. Soap and towel dispensers should be provided. | 1 | |
| BAKER'S TABLE WITH OVERHEAD SPICE BINS: Provide a 30" x 60" stainless steel baker's table with crimped or roll around edges. Unit shall have 3 drawer tier on left end. Overhead baker's spice bins - set of 6 to be mounted on overshelf over baker's table. | 1 | |

| ITEMS AND SPECIFICATIONS | RECOMMENDED AMOUNT OF EQUIPMENT | COMMENTS |
|---|---|---|
| WORK TABLES WITH DROP-IN SINKS: Stainless steel tops. | | |
| Cook's Table - Unit shall be 30" wide and 8' to 9' in length depending on size and shape of floor plan. Top shall be constructed of 14 gauge stainless steel with all edges rolled to a 180 degree radius and with bull nosed corners. With 3 quarter inch coved corner construction. Table shall be supported on iron legs 1 5/8" outside diameter, finished hammertone gray enamel and equipped with stainless steel bullet feet. Provide an under shelf of 16 gauge hot dip galvanized finish hammertone gray, removable type, 12" above floor. Sink shall be furnished with a lever-handled type drain and shall be punched over center wall of compartment to receive a 12" deck type swing faucet. | 1 | |
| Vegetable and Salad Preparation Table - Unit shall provide 2 20" x 20" x 5" stainless steel drawers mounted on roller bearing slides. Sink shall be furnished with a lever-handled type drain and shall be punched over center wall of compartment to receive a 12" deck type swing faucet. Optional: the work table may be provided with an enclosed base with sliding doors. Unit shall be 30" wide and 8' to 9' in length depending on size and shape of floor plan. Top shall be constructed of 14 gauge stainless steel with all edges rolled to a 180 degree radius and with bull nosed corners. | 1 | |
| REFRIGERATION | | |
| REFRIGERATOR: Reach-in institutional type. Stainless steel interior and exterior, hinged doors with rot-proof gaskets or stainless steel hardware. Doors should have magnetic gaskets that are self-closing. Refrigerator should be completely automatic. Interior should be fitted with door-operated electric lights and adjustable shelves or non-corrodible slides for trays. It is recommended to have tray slides in right hand section of one refrigerator for 18" x 26" bun pans, with standard shelves in other sections. Size should be 53" x 32" or equivalent to 45 cu.'. Compressor should be mounted on top. Optional: Refrigerator with doors on both sides for pass-through may be selected if plan of food service requires it. | 1 - 2 | |

| ITEMS AND SPECIFICATIONS | RECOMMENDED AMOUNT OF EQUIPMENT | COMMENTS |
|---|---|---|
| FREEZER: Commercial, upright type preferable. Stainless steel and completely automatic. Size should be 45 cu.' and include full size doors. One side with pan slides 18" x 26", and the other side to have chrome adjustable shelves. Compressor should be mounted on top. | 1 | |
| **DISHWASHING EQUIPMENT** | | |
| DISH TABLE, FOR SOILED DISHES: 14 gauge stainless steel construction. Approximately 27" to 36" wide and lengths depending on size and shape of room. Legs should be stainless steel with adjustable feet and tubular cross rails at least 10" above floor. There should be a scrap block provided near the pre-rinse sink with adequate space provided for scraping and pre-rinsing dishes. This dish table should include the following: | 1 | |
| Pre-Rinse Sink - Size approximately 21" x 21" x 10" with an overhead spray on flexible mount that is controlled by a self-closing hand valve. | | |
| Disposal Unit - Should be designed to pulverize food waste and installed in the dish table with an 18" cove assembly and all necessary parts for complete disposal hook-up with reverse switch and a 1½ HP disposal unit. | 1 | |
| DISH TABLE, FOR CLEAN DISHES: Should be of stainless steel with size approximately 27" to 30" wide. There should be an underneath shelf provided for storage of dish racks. Proper drainage of the table top is essential. The location of this dish table should be next to the dishwashing machine with the length varying according to the layout of the kitchen and size of operation. | 1 | |
| POT AND PAN SINK: This sink should have one compartment that is lowered approximately 4" and provided with a 14 gauge stainless steel perforated cover and a 5 KW thermostatically controlled booster heater that is a low water protector. Sink compartment should be 24" x 24" x 14" deep with all corners coved and welded on a 3/4" radius and equipped with stainless steel bullet feet. A lift type immersible basket should be provided. | 1 | |

118

| ITEMS AND SPECIFICATIONS | RECOMMENDED AMOUNT OF EQUIPMENT | COMMENTS |
|---|---|---|
| WATER HEATER, GAS: Should have rust-proof construction with approximately 85-200 gallon capacity (85 gallons storage per hour - 200 gallon per hour recovery). Water heater should be large enough to supply water to meet 140° to 160 degree temperatures. | 1 | |
| DISHWASHING MACHINE: AM 9-T-2 Hobart dishwasher should be provided or its equivalent. Should be thermostatically controlled for gas or electric heat. Racks are to be furnished with the machine as standard equipment. A 9 KW booster heater should be supplied. (Provide thermostatically controlled heat with low water protection.) | 1 | |
| Pot Brush: Stiff bristles and approximately 3" by 8". | 2 | |
| Wire Brush: Fine steel bristle, approximately 8" to 2". | 2 | |
| Scrapers: Flexible nonmetallic blade 4" to 6" wide for scraping soiled dishes. | 2 | |
| Garbage Cans: Mobile, heavy-duty 32 gallon | 3 | |
| MOBILE EQUIPMENT | | |
| MOBILE UTILITY TRUCK: Heavy duty for all-purpose use in kitchen with open shelves; ball bearing wheels with rubber bumpers. Stainless steel construction and approximately 42" x 18" in size. | 2 | |
| PORTABLE DEMONSTRATION WORK TABLE: with detachable mirror. | 1 | |
| PROOF BOX OR HOT CABINET, PORTABLE: (See page 4 for specifications and cost) | 1 | |
| SERVING EQUIPMENT (This equipment is needed for cafeteria food service. Additional equipment will be needed for catering, banquets, and other special occasions.) | | |
| ICE MAKER (FLAKER): Should be air cooled and have a capacity of 22# delivery and 150# storage. | 1 | |

| ITEMS AND SPECIFICATIONS | RECOMMENDED AMOUNT OF EQUIPMENT | COMMENTS |
|---|---|---|
| PORTABLE HOT FOOD SERVER: Four opening electric hot food table. Size approximately 72" x 27" wide and 36" high. Furnished with sneeze guard and tray slide. Unit shall be mounted on 5" ball bearing casters capable of supporting not less than 2500# each. Should be equipped with brakes on 2 rear wheels and entire unit shall be constructed of 302 type 18-8 stainless steel. Polished to a No. 4 finish. Bottom shall be open and supported by stainless steel square legs fully cross braced on all sides except working side. | 1 | |
| PORTABLE COLD SERVER: Size approximately 72" x 27" wide and 36" high. Furnished with sneeze guard and tray slide. Unit shall be mounted on 5" ball bearing casters capable of supporting not less than 2500# each. Should be equipped with brakes on 2 rear wheels and entire unit shall be constructed of 302 type 18-8 stainless steel. Polished to a No. 4 finish. Bottom shall be open and supported by stainless steel square legs fully cross braced on all sides except working side. | 1 | |
| MOBILE CUP AND GLASS RACK CARRIER: Glass and cup dispensers shall be equipped with automatic self-leveling compression, spring type elevators. Rack elevator mechanism shall consist of proper calibrated non-fatiguing compression spring encased in die stamped, chrome plated brass tubing. Elevator mechanism shall be connected by a removable stainless steel welded rack carrier. Framework should be constructed of 1" 16 gauge, type 302 stainless steel reinforced by 1/2" stainless steel rod. Casters shall be full swivel, tempered ball bearing type with 4" gray non-marking tires. Casters shall be mounted to frame by 2 1/4" threaded stems and secured by chrome-plated, acorn type nuts. Unit shall be sized for 20" x 20" racks. | 2 | |
| MOBILE SILVER AND TRAY RACK CARRIER: Supply portable tray and silver dolly with frame or 1" OD 16 gauge stainless steel tubular construction with top cross bar of 1/2" diameter stainless steel. A shelf constructed with 18 gauge stainless steel with raised, rounded edges on all sides should be provided eight inches above floor. Flanged down to form 1½" wide channel. Shelf to be welded continuously to each leg at all contact points. Casters should be 4" heavy duty, double ball bearing swivel type. Silver and cutlery recepticals should be of 18 gauge stainless steel with 14 gauge stainless steel ending closures and supports all of welded construction. Top with tin die stamped reinforced | 1 | |

| ITEMS AND SPECIFICATIONS | RECOMMENDED AMOUNT OF EQUIPMENT | COMMENTS |
|---|---|---|
| Mobile Silver and Tray Rack Carrier (Cont'd) | | |
| openings for cutlery and silver containers to be furnished with 10 nylon removable silver frames. Overall size should be approximately 34" long by 22" wide x 38" high. | | |
| BUS BOXES (TO USE ON UTILITY TRUCKS): Should be of stainless steel construction with approximate size 15" x 20". | 4 | |
| TRAYS OR DINNERWARE: The type selected would depend on the type and size of food service operation. | | |
| Compartment Trays - heavy-duty plastic (to be used in lieu of serving trays and dinnerware). | 10 doz. | |
| -- OR -- | | |
| Serving Trays - Fiber glass construction in varied colors. 14" x 18". | 10 doz. | |
| Dinnerware - Plastic or chinaware dishes which are not affected by boiling water or chlorine solution. Quantity depends on needs, and includes: | | |
| - Plates, dinner 8" to 9" | 10 doz. | |
| - Plates, bread and butter 6" | 20 doz. | |
| - Soup bowls, 10 oz. capacity | 10 doz. | |
| - Fruit dishes, 4 oz. capacity | 10 doz. | |
| - Cups, 8 oz. capacity | 10 doz. | |
| - Saucers | 10 doz. | |
| TABLEWARE: Should be of one piece construction, stainless steel or triple plated sliverware included: | | |
| Knives | 10 doz. | |
| Forks | 20 doz. | |
| Teaspoons | 20 doz. | |
| Soup spoons | 10 doz. | |
| Iced tea spoons | 10 doz. | |

| ITEMS AND SPECIFICATIONS | RECOMMENDED AMOUNT OF EQUIPMENT | COMMENTS |
|---|---|---|
| GLASSWARE: | | |
| Water Glasses | 10 doz. | |
| Tea Glasses | 10 doz. | |
| Juice Glasses | 10 doz. | |
| Sherbert Dishes | 10 doz. | |
| CASH REGISTER STAND | 1 | |
| CASH REGISTER: Monroe-Swada Model 810A237. Series 80 or its equivalent. | 1 | |
| DISPENSERS: | | |
| Napkin - Corrosion-resistant material | Optional (4) | |
| Straw - Corrosion-resistant material | Optional (1) | |
| SALT AND PEPPER SHAKERS: For Table use | 2 doz. | |
| CREAMER AND SUGAR CONTAINERS | 2 doz. | |
| MILK COOLER: 34" long 30" wide 40" high with total capacity of 1001 half pint cartons of milk. Exterior and interior of lids shall be polished stainless steel. Model to have white enamel sides and galvanized interior and shall be mounted on 5" ball bearing casters. Unit to be cooled by 1/5 HP compressor. | 1 (Optional) | |
| SMALL EQUIPMENT | | |
| BEATER: Rotary; manually operated; commercial type. | 1 | |
| BEVERAGE SERVERS: Seamless stainless steel with vinyl wrapped handle. | 4 - 6 | |
| BOARDS: Cutting, rubber; approximately 10" x 16" by 1/2". Pastry, hardwood; approximately 18" by 24" by 1". | 1 | |

| ITEMS AND SPECIFICATIONS | RECOMMENDED AMOUNT OF EQUIPMENT | COMMENTS |
|---|---|---|
| BOWLS, MIXING: Aluminum or stainless steel. | | |
| 3-4 quart | 4 | |
| 6-8 quart | 4 | |
| 12-16 quart | 2 | |
| 20-25 quart | 1 | |
| BRUSHES: Various types and sizes available; corrosion-resistant handle. | | |
| Pastry | 2 | |
| Vegetable | 2 | |
| CHOPPER OR GRINDER, FOOD: Manually operated; corrosion-resistant cutters with variable type blades; approximately 3 lb. capacity. | Optional | |
| CLEAVER: Light weight, 3/4 to 1 lb.; approximately 6" hardwood handle. | Optional | |
| COLANDER: Aluminum or stainless steel; approximately 11 to 16 qt. capacity. | 1 | |
| CUTLERY: Blades of high carbon content or stainless steel; full tang construction desirable; minimum of 2 rivets; two-piece hardwood handles or equivalent construction. | | |
| Boning - approximately 6" flexible narrow blade. | 3 | |
| Boning - approximately 6" stiff wide blade. | 3 | |
| Electric slicing knife - Heavy duty commercial | 1 | |
| French - approximately 10" blade | 4 | |
| Paring - spear or clip point; approximately 2½ to 3 inch blade. | 6 | |
| Peeler - hand type with a floating blade. | 6 | |
| Slicer, ham or roast - approximately 12" blade. | 2 | |
| Spatula - flexible approximately 8 to 10 inches. | | |
| - Narrow blade | 2 | |
| - Wide blade | 2 | |

| ITEMS AND SPECIFICATIONS | RECOMMENDED AMOUNT OF EQUIPMENT | COMMENTS |
|---|---|---|
| Spreader - flexible, approximately 3" to 4" blade, for spreading sandwiches. | Optional | |
| Steel, Sharpening - approximately 12" long; magnatized. | 1 | |
| Turner, Hamburger - stainless steel; approximately 3 to 4½ inches flat area. | 2 | |
| Turner, Spatula - stainless steel; approximately 10" by 1½" blade. | 2 | |
| CUTLERY RACK: Type suitable for size of food service operation. Number and size would depend on layout of kitchen's work areas. | Optional | |
| FORK, SERVING: 2-tined, forged hardwood handle or equivalent construction. Approximately 10" or 12". | 4 | |
| ICE CREAM DISHERS: Solid stainless steel. Size: 8 or 12 scoops per quart. | 2 | |
| ICE TEA DISPENSER: 2 gallon | 1 | |
| LADLES: Stainless steel; long handle. 1/2 cup (4 ounces) | 2 | |
| MEASURES: Aluminum or stainless steel construction. | | |
| 1 cup size graduated in 1/4 cups | 2 | |
| 1 qt. size graduated in cups | 2 | |
| 2 qt. size graduated in cups | 2 | |
| 1 gallon size graduated in quarts | 2 | |
| OPENERS: | | |
| Can Opener - heavy-duty adjustable table model with parts removable for cleaning. May be mounted on work tables for cooking or salad preparation areas. | 2 | |
| Can and Bottle Opener - Small, hand type. | 2 | |
| PITCHERS: Aluminum or stainless steel construction; 4 to 5 quart size. | 4 - 6 | |

| ITEMS AND SPECIFICATIONS | RECOMMENDED AMOUNT OF EQUIPMENT | COMMENTS |
|---|---|---|
| POTS AND PANS: | | |
| Bake Pans - Aluminum or stainless steel with seamless construction and two drop handles. Depth 2" to 3" and approximately 22" in length by 20" width, or size that is suitable for maximum use of oven. | 6 | |
| Bun or Sheet Pans - Aluminum or stainless steel seamless construction approximately 26" in length by 18" in width x 1" deep or size suitable for maximum use of oven. | 24 | |
| Double Boiler - Aluminum or stainless steel semi-heavy flat bottom insert with fitted cover. | | |
| - 12 qt. insert; 12 qt. pot | 1 | |
| - 20 qt. insert; 20 qt. pot | 1 | |
| Roast Pans - Aluminum with seamless construction and two drop handles. Depth 5" to 6" - 20" to 22" long - 16" to 20" wide, or size suitable for maximum use of oven. | 4 | |
| Sauce Pans - Aluminum or stainless steel of commercial weight with long handle and approximately 4 qt. size. | 2 | |
| Sauce Pans - Aluminum or stainless steel of commercial weight and 2 loop handles and approximately 20 qt. size with 14" diameter. | 4 | |
| Utility or Dish Pans - Aluminum or stainless steel or commercial weight, with or without handles and 14 to 27 qt. size. | 1 | |
| PUNCH BOWL AND CUPS: | 1 | |
| Punch Cups | 10 doz. | |
| Punch Ladle | 1 | |
| ROLLING PIN: Heavy-duty with revolving handles and approximately 14" in length and 4" in diameter. | 2 | |
| SCALES: | | |
| Portion type for ounces | 1 | |

| ITEMS AND SPECIFICATIONS | RECOMMENDED AMOUNT OF EQUIPMENT | COMMENTS |
|---|---|---|
| Scales (Cont'd) | | |
| Portion type for pounds | 1 | |
| Platform Scales - depending on size of operation | Optional | |
| SCRAPER, BOWL: Flexible nonmetalic blade, 4" to 6" wide. | 2 | |
| SCOOPS: | | |
| Dishes for Portioning - Stainless steel with wood or plastic handles. Size: | | |
| - No. 6 (2/3 cup) | 1 | |
| - No. 8 (1/3 cup) | 2 | |
| - No. 12 (1/3 cup) | 4 | |
| - No. 16 (1/4 cup) | 2 | |
| - No. 20 (3 tablespoons) | 1 | |
| Dry Ingredients - Aluminum or stainless steel; 1 qt. size. | 1 each container for dry ingredients | |
| SHAKERS: Aluminum or stainless steel; approximately 3" diameter and 4" depth for salt and pepper. For kitchen use. | Optional (4) | |
| SHEARS, KITCHEN: Steel; 7 to 8 inches in length | 1 | |
| SIEVE, FLOUR: Aluminum construction; 16" to 20" diameter. | 1 | |
| SPOONS: | | |
| Measuring - Aluminum or stainless steel; graduated, 1/4 teaspoon to 1 tablespoon. | 4 | |
| Mixing - Stainless steel; 11" to 13" long. | | |
| - Solid | 4 | |
| - Perforated or slotted | 2 | |

NEW MEXICO

Major activities during the quarter included: (1) a statewide recurring manpower survey, (2) a high school curriculum evaluation, (3) the development of guidelines for a transition from a 3-year program in nursing to a 2-year associate degree program, (4) a followup study of graduates at Northern New Mexico State School, (5) a survey to determine priorities of activities of vocational-agriculture teachers, (6) an agreement to fund six position papers in cooperation with the Designing Education for the Future Project, and (7) a display of ERIC materials at the State Teachers' Convention. Materials disseminated consisted of project reports, informational packets for vocational teachers in New Mexico, publications, and research material. The professional staff attended the Training Session ERIC System in Columbus, Ohio, and the State Teachers' Convention and the Conference on Innovative Concepts in Secondary School Scheduling in Albuquerque, New Mexico. Proposed new studies included a comprehensive post-secondary vocational student followup at the three remaining area vocational schools and conferences with the instructional staff of the State Department of Education and the home economics supervisor of Albuquerque Public Schools to plan a project for curriculum revision. # INTRODUCTION

This is the third quarterly report under the New Mexico Research Coordinating Unit Continuation grant encompassing the period September 1, 1967, through November 30, 1967.

The format of this report has been changed to comply with recommended outlines set forth in the publication "Preparing Reports Based on Research Supported by the Office of Education, Bureau of Research", dated July 1967, Office of Education, U. S. Department of Health, Education, and Welfare.

## I. MAJOR ACTIVITIES AND ACCOMPLISHMENTS DURING THIS PERIOD

### A. Statewide Recurring Manpower Survey

The staff of the Research Coordinating Unit has designed a yearly recurring manpower survey of business establishments which are listed in the yellow pages of towns in New Mexico having a population of 2,000. The Unit served as the State coordinating agent and worked with a local coordinator from each school district in approximately forty communities. Vocational students conducted the survey at the community level. Meetings for orientation purposes were conducted in six areas of the State with the coordinators who worked on the study. The staff is now processing all questionnaires received, assigning occupational codes to the job descriptions. Returns have been received from 80% of the participating schools. Work on this project has been the major activity of the staff during the reporting period.

### B. High School Curriculum Evaluation

The doctoral dissertation entitled "The Effect of the High School Curriculum upon College Success" was completed during this period. The study by Dr. Rock Ashcraft of Alamogordo Branch, New Mexico State University, investigated the differences between the success of college students who have had a large concentration of college preparatory courses and those who have had vocational training in high school. This study should be of help to counselors and principals in evaluating curricula for college-bound students. This project was completed on October 15, 1967; cost $5,934. Copies in limited numbers are available upon request.

### C. A Transition in Nursing Education

The transition from the three-year nursing program to the two-year associate degree program is one that has proven most difficult to many nursing programs. The Regina School of Nursing, University of Albuquerque, developed guidelines for this transitional period. This project was completed on October 1, 1967, with an expenditure of $5,220.20 of Research Coordinating Funds. Copies in limited numbers are available upon request.

### D. El Rito Manpower Follow-up Study

The Research Coordinating Unit provided assistance in completing a follow-up study of persons graduating from vocational training programs at the Northern New Mexico State School at El Rito. This project, a comprehensive follow-up, provides such information as salaries, area of mobility, employment in area of training, and number of promotions. This project was completed in September, 1967, at a cost of $857.75.

E. A Survey to Determine Priorities of Activities of Vocational-Agriculture Teachers

This survey was conducted by the Research Coordinating Unit in cooperation with the State Supervisor of Vocational Agriculture and will provide a comparison of selected priorities as seen by vocational-agriculture teachers compared with the priorities as seen by their administrators. A portion of the time of the staff was devoted to compiling data returned on this study, which will be completed in the next reporting period.

F. Designing Education for the Future

The Research Coordinating Unit agreed to fund six position papers in cooperation with the Designing Education for the Future Project. These papers should be completed in late summer of 1968 at a total cost of $600. The secretarial staff of the Unit also assisted in a one-day conference for the Designing Education for the Future Project in Albuquerque, New Mexico, on December 8, 1967.

G. ERIC

A display and information booth was sponsored jointly by the Research Coordinating Unit and the Research Division of the State Department of Education at the State Teachers' Convention in Albuquerque, New Mexico, October 25-27, 1967. Information on the ERIC System was disseminated, availability of microfiche explained, and duplication of fiche and hard copy demonstrated, along with the use of microfiche readers. The same information was shown in a television appearance on the educational channel in Albuquerque, New Mexico, by the Director of the Research Division and Assistant Director of the Research Coordinating Unit on December 4, 1967.

H. Development of Area Vocational Schools

During this reporting period the Director of the Research Coordinating Unit attended several conferences in the State, working with the curriculum committee in planning the development of area vocational schools.

## II. PROBLEMS

There were some problems encountered in conducting the major project of the Unit, the Statewide Recurring Manpower Survey. The original PERT scheduling was unrealistic in that allowances were not made for the inevitable delays which occurred. There was lack of interest in some areas by school personnel and indifference on the part of some businesses as to the need for the survey Incomplete questionnaires presented considerable difficulty to the staff in interpretation for coding purposes.

## III. SIGNIFICANT FINDINGS AND EVENTS

The results of the particular studies funded by the Unit were published in the individual project reports.

## IV. DISSEMINATION ACTIVITIES

A. Copies of all Research Coordinating Unit project reports and the last quarterly report were mailed to:

(1) Acquisition Specialist
Information Retrieval Dissemination Division
The Center for Vocational and Technical Education
The Ohio State University
980 Kinnear Road
Columbus, Ohio

(2) State Records Administrator
State Records Center and Archives
State of New Mexico
Santa Fe, New Mexico

(3) Directors
All Research Coordinating Units

(4) Other interested individuals or institutions upon request of the project consultant

B. Information dispensed at State Teachers' Convention and through television appearance, as described in Section I (G) above.

C. Newspaper publicity relative to Manpower Needs Survey, copies attached as Appendix A.

D. Informational packet containing the following information was sent to all vocational teachers in New Mexico:

(1) A Research Coordinating Unit publication entitled "Vocational-Technical Education in New Mexico"

(2) Information on obtaining a second publication entitled "Procedures for Establishing Area Vocational Schools in New Mexico"

(3) A directory of area vocational schools and private vocational schools in New Mexico

(4) Information on obtaining loans for vocational students and eligible schools in New Mexico

E. Considerable routine correspondence requests for publications and research material

## V. CAPITAL EQUIPMENT ACQUISITIONS

None

## VI. FORMS

None

## VII. OTHER ACTIVITIES

The professional staff attended the following conferences during the reporting period:

A. October 11-13, 1967, Training Session ERIC System, Columbus, Ohio

B. October 25-27, 1967, State Teachers' Convention, Albuquerque, New Mexico

C. November 21-22, 1967, Conference on Innovative Concepts in Secondary School Scheduling, Albuquerque, New Mexico

## VIII. STAFF SUMMARY

| Name | Title or Function | Funds Federal | Funds Local | Period Employed | Percent of Time |
|---|---|---|---|---|---|
| Dr. Joel W. Price | Director, RCU | x | | Total Reporting Period | 100% |
| W. J. Barnes, Jr. | Assistant | x | | " | 100% |
| Margaret Ann Fegan | Secretary | x | | " | 100% |
| Helen Maestas | Stenographer | x | | " | 100% |

Consultants on individual studies paid as per project agreement, shown in Section I above.

## IX. FUTURE ACTIVITIES PLANNED FOR NEXT REPORTING PERIOD

Completion of projects already instituted and described in preceding progress reports, as follows:

A. Recurring Statewide Manpower Needs Survey

B. Survey to Determine Priorities of Activities of Vocational-Agriculture Teachers

C. Designing Education for the Future

D. Continued dissemination of ERIC Research

E. Development of Area Vocational Schools

F. Mobile Laboratories

G. Tape Recorded Occupational Information

H. Home Economics Study

I. Waitress and Food Handling Occupational Training Program

J. Survey of Female Vocational-Technical Education Students in Southeastern New Mexico

New Studies Proposed:

A. A comprehensive post-secondary vocational student follow-up at the three remaining area vocational schools in the State, to be incorporated with the El Rito Study.

B. Confer with the instructional staff of the State Department of Education and the home economics supervisor of the Albuquerque Public Schools to plan a project for curriculum revision for home economics.

MANPOWER SURVEY STUDENTS — These vocational education students under direction of faculty advisor James Sanchez will conduct Vocational Manpower Needs Survey here from Oct. 2 through 13. Survey is sponsored by Research Coordinating Unit of Vocational Division of State Department of Education in co-operation with chamber of commerce. From left, standing, David Volquardsen, Leonard Shows, Mike Allen, Rick Hewlett, Stephen Long, Romeo Klein, Francis Graham, Sanchez and Don Boone; Seated, Anna Tumey, Shirley Temple, Brenda Croley, Dian Parsons and Janice Bryant.

## Manpower Survey Due In October

A statewide Vocational Manpower Needs Survey will be conducted here from Oct. 2 through 13. The survey will be conducted by James Sanchez a faculty member of Ruidoso High school, and his vocational education students.

The survey is sponsored by the Research Coordinating Unit of the Vocational Division of the State Department of Education in co-operation with the Ruidoso-Hondo Valley Chamber of Commerce. The information gathered from 44 population centers throughout the state will be processed by the Statistical Division of the State Department of Education.

The information will be gathered here by the students personally visiting each business and asking about their employee needs. The data gathered will be available to school, city, county and state personnel. In addition, it will be used to plan future vocational training programs such as the one recently started in Roswell, Sanchez reports.

## Vocational Survey Set By Students

One hundred vocational educational students from Mayfield and Las Cruces High Schools will begin a survey Monday of vocational manpower needs in Las Cruces.

Similar surveys are being conducted during the next several weeks in 44 population centers throughout the state. Sponsor is the Vocational Division, State Department of Education, in cooperation with local Chambers of Commerce.

Taking part in the Las Cruces endeavor will be some 40 members of the Las Cruces High School chapter, Distributive Education Clubs of America; 35 members from the Mayfield chapter; 22 members of the Mayfield Office Education Association; and several members of the Mayfield chapter, Future Business Leaders of America.

Students will conduct the survey on their own time and will not miss any school classes, said Miss Della Taylor, project coordinator, Mayfield High School vocational education teacher. Assisting her from Las Cruces High School is Joe Solano, distributive education teacher.

Businessmen will be asked information concerning the number of and the job description of their employees. The data will be compiled and made available for planning purposes to local, county, and state personnel as well as to educators throughout New Mexico.

# Job Survey Is Set in Gallup

Students of the Gallup High School Distributive Education class will conduct a vocational manpower survey in Gallup starting Monday, Larry Dorman, teacher coordinator for the group announced today.

Results of the survey will provide data to help in planning future vocational programs in Gallup and New Mexico schools. The state-wide endeavor, conducted through the research coordinating unit of the State Department of Education, will help establish vocational needs by various business categories. The project has been approved by the Gallup - McKinley County Chamber of Commerce.

The students, furnished with a standardized form, will contact each business listed in the yellow pages of the local telephone directory. Information gathered in Gallup will be processed by the Department of Education statistical division. Results will be available to school officials and agencies which are concerned with business and economic development in New Mexico.

# Getner and Cox To Head Survey

A statewide Vocational Manpower Needs survey will start here in Socorro, this week. The survey, conducted by the Research Coordinating Unit of the Vocational Division of the State Department of Education, in cooperation with the Chamber of Commerce, will use local high school students under the direction of Gus Getner and Vernon Cox, high school teachers.

The students will be contacting each business listed in the Yellow Pages of the local telephone directory. This information, gathered from 44 population centers in New Mexico will be processed by the Statistical Division of the State Department of Education.

This project, endorsed by the Chamber of Commerce, will provide needed data to help in planning and designing future vocational programs in New Mexico. Information from this survey will be available to school, city, county and state personnel.

# Labor Survey Starts

A statewide Vocational Manpower Needs Survey will start in Los Alamos this week.

The survey, conducted by the Research Coordinating Unit of the Vocational Division of the State Department of Education, in cooperation with the Chamber of Commerce, will use high school student council members to conduct the survey.

The students will be contacting each business listed in the Yellow Pages of the local telephone directory. This information, gathered from 44 population centers in New Mexico will be processed by the Statistical Division of the State Department of Education.

This project, endorsed by the Chamber of Commerce, will provide needed data to help in planning and designing future vocational program s in New Mexico. Information from this survey will be available to school, city, county, and state personnel.

Merchants and businesses are asked to cooperate with these students as they conduct this survey which will continue for two weeks.

# LA Schools Conduct Job Survey

Students from Los Alamos High School organizations will be conducting a survey the last two weeks of this month to obtain current information on job vacancies and expected needs of Los Alamos employers.

The clubs, says school administrator Dr. Duane W. Smith, will be selected as soon as school is open and "things settle down a bit."

The Los Alamos students will be gathering information which will be forwarded to the Research Coordinating Unit of the Vocational Division of the State Department of Education.

Los Alamos is one of the 40 communities in New Mexico participating in the survey.

Dr. Smith, who will coordinate the research efforts, attended a coordinators meeting for the program in Espanola recently. The meeting was designed to train coordinators in conducting the survey in their respective communities.

Peggy Corbett, Chamber of Commerce manager, said this survey is similar to one the Chamber of Commerce took in cooperation with New Mexico State University several years ago. The earlier survey, she said was not documented and computerized, and the upcoming survey will update the first.

"The information will be used by the whole state," Mrs. Corbett said, "in finding out what we have to offer in the way of employment and what training will be required to fill those jobs."

"With that information in hand, schools will be trying to fit the training to meet the need," she said.

# October Date Set For Survey

A statewide Vocational Manpower Needs Survey will begin in Jal Oct. 9. The survey, conducted by the Research Co-ordinating Unit of the Vocational Division of the State Department of Education, in co-operation with the Chamber of Commerce, will use local high school seniors under the direction of E. A. Miller, Industrial Arts teacher.

The students will be contacting each business listed in the Yellow Pages of the Jal telephone directory. This information, gathered from 44 population centers in New Mexico, will be processed by the Statistical Division of the State Department of Education.

This project, endorsed by the Chamber of Commerce, will provide needed data to help in planning and designing future vocational programs in New Mexico. Information from this survey will be available to school, city, county and state personnel.

# Job Needs Survey To Be Taken

E. A. Miller attended a coordinator's meeting on Vocational Education Aug. 23 at Artesia.

The meeting is the beginning of a Statewide Vocational Manpower Needs Survey which is being sponsored by the Research Coordinating Unit of the Vocational Division of the State Department of Education in cooperation with the local Chamber of Commerce.

This meeting is designed to train coordinators to conduct the survey in his local community. Instruction will be given on the coordination of the survey which will take place in October and November of this school year.

Purpose of the survey is to obtain current information as to the job vacancies and expected needs of employers in 40 communities in New Mexico in a short time period.

*VOCATIONAL EDUCATION; HIGH SCHOOLS; ADULT VOCATIONAL EDUCATION; POST SECONDARY EDUCATION; POPULATION TRENDS; EMPLOYMENT OPPORTUNITIES; EDUCATIONAL NEEDS; *PROGRAM EVALUATION; JOB TRAINING; FEDERAL PROGRAMS; *STATE PROGRAMS; SURVEYS; TECHNICAL EDUCATION; EDUCATIONAL GOALS
NORTH DAKOTA

This study was designed to analyze the adequacy of present training programs and the needs to provide a sound basis for further development of vocational education in North Dakota. The project was initiated at the request of the State Director of Vocational Education and the State Board for Vocational Education. A rationale for vocational education and goals for occupational education were presented in support of the study. State agency annual descriptive and statistical reports provided information on the facilities and services currently available in (1) programs of vocational education at the secondary, adult, and post-secondary levels, (2) supplementary programs such as Manpower Development and Training Act, Rural Area Redevelopment, Job Corps, labor unions, and private vocational school, and (3) ancillary services. Studies, technical reports, U.S. Department of Labor reports, and other publications provided information on national, regional, and state population, education, and employment. A Research Coordinating Unit survey furnished information about employer's vocational needs and opinions about vocational education programs. It was concluded that the vocational education program in North Dakota is not adequate for the present needs of its people. Based on the findings, recommendations were made for expanded programs of education for vocational education teachers, reorganized and expanded administration and supervision, expanded vocational programs at all levels, the development of a research section within the Department of Vocational-Technical Education, and the development of more efficient ways of administering and financing vocational education in North Dakota. ## Foreword

This report is a review and synthesis of research related to vocational and technical education in North Dakota. Originally initiated by the State Board for Vocational Education as a Statewide Manpower Study with the primary purpose of determining the training needs for the state, the project has developed into a many-faceted study of wide scope and interest. As the study has developed and changed in an effort to find the answers for the varied and complex problems facing vocational educators, so has the name been changed to A Review and Synthesis of Research Relating to Vocational Education in North Dakota.

This review and synthesis of research is an attempt to provide information for the very difficult questions which must be answered in order to provide a sound basis for the further development of vocational education in North Dakota. The reader will be aware that the ideas presented in this report are by no means intended to be final and absolute. Research alone cannot provide answers for some of the problems that we face in vocational education. Only through wise and considered interpretation of research findings and continuous evaluation of the needs of business and industry can the leaders in vocational education provide the guidelines for a practical and viable program.

The reader of this report will become acutely aware of the need for a continued research effort. Research does not always produce

complete, non-biased solutions to vexing and complicated educational problems. However, it can produce data, and often conclusions, which make human decisions, reached by the weighing of values, much more reliable. If this report enables the reader to participate in the interpretation of data and in the reaching of defensible courses of action, it will have served its purpose.

Norman D. Ehresman, Director
Center for Research in Vocational
and Technical Education
University of North Dakota

ACKNOWLEDGMENTS

It is difficult to identify everyone whose contribution to this project should be acknowledged. Members of the present staff at the Center for Research in Vocational and Technical Education (Research Coordinating Unit for North Dakota) were not involved in the early phases of the project and consequently do not have first-hand knowledge of all of the contributions. In the event that any persons are overlooked, the reader will be assured that it was not intentional.

The project was initiated in the fall of 1965 at the request of the State Director of Vocational Education and the State Board for Vocational Education. The continued interest and patience of the members of the State Board have been appreciated. Mr. LeRoy H. Swenson, State Director of Vocational Education has contributed a wealth of support by his careful review, extraordinary patience, and commitment to finding answers on which better decisions could be based.

Professors E. H. Nagel, T. J. McCrystal, and C. H. Matz were responsible for the conduct of the project until July 1967. After the data gathering phase of the project ended (July 1967) a staff of four people headed by Dr. Norman D. Ehresman proceeded with the analysis and synthesis of the material collected. Appreciation is extended to the many student assistants who helped with data compilation and other tasks associated with the project.

Special appreciation is extended to the many businessmen, school administrators and teachers who cooperated with the RCU in the conduct of the necessary surveys and interviews. The authors are deeply indebted to Mrs. James Barker, Mrs. Byrum Cartwright and Mrs. Virginia Devine for the countless hours of editing, typing, and proofreading, and to Drs. E. F. Krahmer and J. D. Williams for assistance with the statistical analysis of data. Dr. Thomas P. Johnson, who served as a research assistant during the early phases of the project, has also served as a consultant during the past few months.

## Chapter I

## INTRODUCTION

From the time of Benjamin Franklin to the present, vocational education has been a controversial area of education. By its nature it is practical and dynamic, requiring continuous examination to meet the changing conditions of the world of work to which it is directed. In response to the needs of society, vocational education has expanded from the early apprenticeship training programs to the present broad, comprehensive program designed to prepare youth and adults for gainful employment. Leaders in vocational education brought about a good part of this change through their wisdom and foresight in analyzing the needs of society, and in turn, relating these needs to the training programs offered by various schools and colleges in the United States.

This study is yet another in the continuing series of studies designed to analyze the adequacy of present training programs and the needs of the society in order to readjust vocational and technical education to better meet those needs.

The welfare of the people of North Dakota and the general economic level of the state depends largely upon the ability of the people of the State to produce services and products. Such abilities or capacities depend upon the people's skills and knowledge. Since the skills and knowledge to provide useful services and to produce valuable products are becoming greater and more complex, it becomes necessary for the State

of North Dakota to maintain a program of education to keep pace with these needs. Vocational-technical (occupational) education should be an important part of the state's total program of education.

Occupational education is a part of the total structure of education. It is difficult, if not impossible, to separate the vocational from the general or non-vocational part, except by looking at the objectives of the students and teachers. Education in the broadest sense embodies preparation for employment. The nature of this preparation for employment may be general and undifferentiated in the early years, as is typical in the elementary or junior high school, or directed toward the study of a specific occupation or group of occupations as is typical in the high school or post-high school programs.

In the elementary schools, vocational emphasis should be on the study of the world of work and exploration of the available occupational opportunities. The purpose at this level is to give the individual the richest possible experience, preparing him not only to make a wise occupational choice, but also to continue his education in his chosen occupation. At the junior high school level the curriculum becomes slightly more specialized, courses at this level should allow the individual to further refine his occupational choices and make a beginning in the development of skills and knowledge required for those occupations.

At the high school level differentiation should be made between the first two years and the second two years. The first two years may be considered for some an extension of the exploration of the world of work and beginning of the learning of skills and knowledge needed for the chosen

occupation. For others, those who will not continue beyond the first two years of high school, the vocational offerings must be considered terminal; that is, for some persons the occupational education received at the ninth and tenth grade levels in high school will be the only vocational education that they receive and therefore must be designed to prepare them for the world of work.

For those persons who will complete high school, the vocational education offerings can further be divided into two categories. In the first category there should be a terminal vocational education for those who are not likely to attend any formal schools beyond high school. The second category, for those most likely to continue their formal schooling beyond high school, should consist of vocational offerings in the high school, oriented and designed to serve as a preparation for further vocational training. At the post-high school level (junior colleges and technical institutes) the program would vary in length from less than one year to three years, covering a wide variety of occupations in trade and industrial, business and commercial, distributive, agricultural, home, and service fields. The training at this level ranges from the semi-skilled occupations to the highly technical fields.

In this report, the terms "Vocational Education" and "Occupational Education" are used interchangeably and apply to particular courses providing specialized knowledge and skills for specific occupations. This definition includes technical education and certain types of adult and continuing education.

Vocational education has outgrown its role as a traditional educational program for certain students. It is now viewed as a means of

eliminating unemployment and raising the economic status of individuals and geographic areas. As a result of the Vocational Education Act of 1963, wide and varied programs of vocational education may become available through existing and new educational agencies to a wider segment of the population than has heretofore been served. In this study of occupational education in North Dakota, an attempt has been made to include the total range of vocational education.

## A RATIONALE FOR VOCATIONAL EDUCATION

Sociologists, educators, economists and politicians generally agree that vocational education is a vital part of the educational spectrum.

> "Occupational education holds the promise of the diversity and practicality that the educational system now lacks in its efforts to educate all our young people to their full potential. Indeed it is no accident that the city with the most extensive program for secondary vocational education (Milwaukee) is the one that graduates 94% of its students from high school, and that the state with the greatest occupational education opportunities beyond the high school (California) has been able to induce so many of its high school graduates to continue their education."[1]

A recent nationwide study by the American Institute for Research revealed that the vocational high school graduates as compared with non-vocational graduates, obtained jobs more quickly, had more employment security, had similar conversational interests, leisure time activities, and affiliations with community organizations.

The production and service organizations in North Dakota demand personnel with skills and knowledge. Vocational education has a very

---

[1]Grant Venn, Man, Education and Work, American Council on Education, 1964.

definite economic value to the many business organizations in North Dakota in that it could provide them with trained personnel. The rapid mechanization and automation of so many industries and businesses requires continuing development of vocational education programs. Economists who have studied extensively the value of education see little doubt that in any cost-benefit analysis, the values of human capital and vocational education are readily visible. The further growth and development of business and industry in North Dakota depends to a great extent on the availability of trained employees.

It is very likely that there are positive political values to be derived from an expanded program of vocational education. One primary stimulus to our nation's achieving a position of international leadership has been our ability to produce vast quantities of a great variety of goods. Our ability to survive as a nation may well depend on our increased ability to produce efficiently and effectively. As one of fifty states, North Dakota must strive to develop its human capital to its fullest potential; in this development an expanded vocational education program would seem to be essential.

Recent economic studies provide evidence that education as an investment of society produces immediate returns in terms of greater production, greater income tax revenues, lessened costs of social welfare, and a lower cost in social delinquency. If North Dakota is to continue to participate in the growth and development of business and industry and the expanded economy of the country, means must be found for supplying trained workers with the types of skills and knowledge needed by tomorrow's businesses and industries.

The social value of vocational education, long widely recognized, has helped to stimulate Federal expenditures of millions of dollars in recent years to make more people employable, thus providing them and their families with economic security. Sociologists would agree that economic security contributes to the social, psychological, and physical well-being of the individual and his family. Although vocational education obviously is not the sole nor the complete solution to socio-economic problems, it appears that its place in the schools and colleges offers the point of best attack against the cycle of low economic growth, unemployment and inadequate education. It is in the classroom and laboratory that the proper attitude, aptitude, skills and knowledge can be acquired. Vocational education can - and does - provide the necessary skills to make people employable and economically secure. Not surprisingly, the lowest unemployment rate in the nation is found among those persons who have had partial or complete vocational training.

## GOALS FOR OCCUPATIONAL EDUCATION IN NORTH DAKOTA

The introduction to this review and synthesis of research related to the vocational and technical education needs of North Dakota must include examination of some of the statewide objectives which could be accomplished with a well planned comprehensive system of occupational education in the state. Some of the goals for occupational education which may be defined are:

1. To provide a vocational education program accurately reflecting the needs of employers within the state. The present research is a mere beginning in the area of identifying employer needs. Many additional studies in specific occupational areas will be required for constant revision of training programs,

and to meet the constantly changing employer needs, job descriptions, and the consequent changes in needed skills and knowledge.

2. To make vocational education available to every citizen in the labor market of North Dakota. Programs designed and implemented for in-school youths in pre-vocational and vocational areas should be supplemented by similar programs for youths, school dropouts and adults having certain vocational training needs. These individuals require training for initial employment or for upgrading and retraining for changing occupational opportunities or advancement.

3. To reduce unemployment. A sound, well-developed vocational training program could transfer many people from the "unemployable" to the "employable" class, thereby lending force to the drive for full employment, long considered a major goal of our society.

4. To increase the holding power of North Dakota. It is well known that many people leaving North Dakota give as their reason the lack of employment opportunities; at the same time, many employers are actively seeking job candidates. Perhaps the difficulty is not a lack of job opportunities, but a lack of appropriate training programs for such opportunities.

5. To involve the business, labor, and industrial communities in the vocational education process. A sound system of vocational education probably cannot be developed by the school alone. Procedures must be found whereby the school and business communities can work together to develop and constantly redevelop the vocational education in the state.

6. To provide the necessary ancillary services to vocational education in North Dakota. A total, viable program of occupational education in North Dakota will require continuous research efforts, a degree of independence from traditional methods, and a constant search for new ways of improving the effectiveness of our training programs. There is a great need for an expanded occupational information and vocational guidance program at many levels of education, including adult education; for specialized administration and supervision of programs, and for highly specialized teacher education programs in all areas of vocational education.

7. To expand the employment opportunities in North Dakota. Vocational education can have a direct influence on the number of employment opportunities available. Many research studies reveal job openings unfilled in rural areas because of a lack of trained applicants. If these openings can be filled with trained personnel, there will be obviously an expanded growth of the local economy, which in turn will stimulate expansion of employment in those areas.

The evidence indicates we have not been providing the kind of education that prepares persons for the kinds of opportunities presently available. If persons are not prepared for the employment possibilities that are available, they will continue to move to other sections of the country in an attempt to find those kinds of jobs for which they think they are prepared. The truth is, with an expanded, properly designed, and well-organized system of vocational and technical education, the out-migration of young people from our state could be substantially reduced. At the same time, the business and industries, in effect, the economic growth, of North Dakota could be substantially increased. Simply providing persons with a high school, junior college, or college education does not necessarily make them employable. Organized programs that prepare the individual for existing or emerging occupations, or clusters of occupations, must be designed. This may be considered an investment, not an expenditure for North Dakota.

# Chapter II

## THE PRESENT PROGRAM OF VOCATIONAL EDUCATION SERVICES

### INTRODUCTION

An accurate assessment of the status of vocational education must begin with a descriptive account of the facilities and services currently available. This report will be concerned with formal training programs only.

Vocational development is a life-long process beginning very early in life and following the same patterns as personality development. Thus, there is a definite need to provide students with successful school experiences beginning in the early grades. Many students in these early grades lose their motivation to learn and seldom benefit from the educational opportunities available to them later. Many never acquire basic academic and communication skills and are consequently handicapped, often beyond recovery. Therefore, a well-planned, integrated, and continuous program of success experiences, academic progression, exploration and development of usable skills, and life/work experiences appears to be absolutely necessary as the background for adequate educational and vocational development. Vocational preparation of an exploratory nature must begin in the elementary school, grow more specific in high school and continue throughout life.

## HIGH SCHOOL VOCATIONAL PROGRAMS

Vocational education opportunities at the secondary school level in North Dakota are limited. Table 1[1] presents the number of programs available to high school youth together with the percentage of the total 1966-1967 public high school enrollment and number of teachers. The

TABLE 1

HIGH SCHOOL VOCATIONAL EDUCATION STATUS - 1966-1967

| TYPE OF PROGRAM | NUMBER OF PROGRAMS | TOTAL ENROLLMENT | TEACHERS PART TIME | TEACHERS FULL TIME | % OF TOTAL HS ENROLLMENT IN 1966-1967 |
|---|---|---|---|---|---|
| Agriculture | 64 | 3192 | 49 | 21 | 7.07 |
| Trade and Industrial | 2 | 86 | 0 | 3 | .19 |
| Office Education | 35 | 1787 | 50 | 53 | 3.95 |
| Distributive Education | 8 | 372 | 4 | 4 | .82 |
| Home Economics | 113 | 6887 | 97 | 37 | 15.25 |
| Home Economics (For Gainful Employment) | 2 | 35 | 2 | 0 | .07 |
| TOTALS | 224 | 12359 | 202 | 118 | 27.35 |

percentages of the total high school enrollment show that approximately 27.35 per cent of the school students actually become participants in one or more vocational education programs.

There is no proportionate distribution of vocational education opportunities throughout the state which leaves many students with relatively

[1]Annual Descriptive and Statistical Report, North Dakota State Board for Vocational Education, 1967.

few, if any, training opportunities. That this is manifestly true for the rural areas can be seen by plotting the geographical locations of the vocational education programs. The larger population centers have vocational education opportunities not found in smaller communities or rural areas. This leaves the 41 per cent of the students who are enrolled in 258 high schools enrolling fewer than 200 students with proportionately fewer opportunities. Also, of the 307 accredited and non-accredited public and parochial high schools in the state, only 149 (less than one-half) offered courses in one or more of the vocational services.[2] This concentrates the vocational education opportunities in the high schools enrolling 300 or more students.

Further complicating the picture is the fact (see Table 1) that the only two vocational education programs reaching a large number of students are vocational home economics (15.3 per cent) and vocational agriculture (7.1 per cent). Even though agriculture programs reach 7.1 per cent of the students, many of the programs are not oriented in terms of the changing job structure in agriculture.[3] Agriculture-related occupations are increasing while farming and ranching opportunities are decreasing, emphasizing the greater need for off-farm agricultural training opportunities. Yet there is only one agri-business program in operation in the state. The vocational home economics enrollment figure includes only two programs that are designed to train students for specific

---

[2]State of North Dakota 60th Annual Report of the Director of Secondary Education to the Superintendent of Public Instruction, 1967.

[3]Vocational Education in Agriculture in North Dakota, Annual Descriptive Report, 1967.

occupations.[4] If only the home economics programs for gainful employment are included, the total enrollment in vocational courses in high schools is reduced to 12.10 per cent.

Office education provides opportunities for 3.95 per cent of the students; the other vocational education opportunities are limited. With only two trade and industrial vocational programs and eight distributive education programs, representing demand from two of the fastest growing segments of the labor force, it is apparent that many student and employer needs are receiving inadequate attention.

There are no public school employees in North Dakota specifically designated as vocational counselors. There are 84 certified public school counselors operating 48 approved guidance programs.[5] Each program should include as a part of the total guidance effort, some vocational guidance and occupational counseling. In North Dakota 18,583 or 42 per cent of the students do not have the services of any counseling program, and even fewer students have the benefit of vocational counseling. Again, it is the larger school which provides specialized counselors while the small school typically does not.

A questionnaire survey of 3,681 North Dakota high school seniors reveals some of the plans and attitudes of high school seniors regarding vocational education.[6] Figure 1 represents the future plans of high school

seniors. Seven per cent of the students plan to attend a vocational-technical school and in addition seven per cent plan to attend a private or business school. Fifty-three per cent of the students plan to attend a college or university. Eleven per cent of the students

TABLE 2

POST-HIGH SCHOOL TRAINING PROGRAMS DESIRED
BY 1966 NORTH DAKOTA HIGH SCHOOL SENIORS

| MALE | FEMALE |
|---|---|
| Drafting | Nursing |
| Engineering | Sales |
| Electronics | Accounting |
| Construction | Bookkeeping |
| Heavy Equipment Operation and Maintenance | Secretarial |
| Auto Mechanics | Clerical |
| Auto Body Rebuilding | Business |
| Farming | Cosmetology |
| Agriculture | |
| Farm Management | |
| Farm Equipment Mechanics | |
| Forestry | |
| Sales | |
| Accounting | |
| Business | |
| Welding | |

plan to get a job, six per cent expect to enter military service and seven per cent have no definite plans. Those who plan to enter the labor force immediately upon graduation aspire chiefly to jobs of the unskilled or semi-skilled variety.

Figure 2 shows the vocational course credits earned or anticiated upon graduation. The only area of vocational education in which

FIGURE 2

VOCATIONAL COURSE CREDITS EARNED OR ANTICIPATED
UPON GRADUATION BY HIGH SCHOOL SENIORS

a sizable number of credits are earned is that of business and office education. The majority of the credits earned are in typing.

Table 2 presents the post-high school training programs or courses desired by North Dakota high school seniors. Only the larger categories are listed.

Fifty-three per cent of the males and 35 per cent of the females stated that they would have liked to have taken additional high school vocational education courses. Thirty-seven per cent stated that such courses were not offered or there was a schedule conflict.

Implementation of the Area Vocational High School concept as presented in the Preliminary State Manpower Study report is only beginning. As of December, 1967, Dickinson and Fargo are the only two high schools specifically designated by the State Board for Vocational Education as Area Vocational High Schools. The Dickinson Area Vocational High School is not scheduled to begin operation until September, 1968. The impact of these schools on the vocational education situation in North Dakota will not be accurately known until evaluation studies can be made.

## ADULT AND POST-SECONDARY VOCATIONAL EDUCATION

Adult evening and post-secondary vocational education opportunities are available from many agencies. These include federal, state and local programs, public and private sources as well as academic settings. The following agencies are involved in vocational education:

| | |
|---|---|
| High Schools | Vocational Rehabilitation |
| Junior Colleges | Vocational Rehabilitation for the Blind |
| Colleges and Universities | N.D. Association for the Mentally Retarded |
| Area Vocational Schools | Crippled Children Services |
| Labor Unions | State School for the Deaf |
| Private Vocational Schools | State Industrial School |

| | |
|---|---|
| Business and Industry | State Penitentiary |
| Job Corps | Bureau of Apprenticeship Training |
| Rural Area Redevelopment | Manpower Development Training Act |
| Bureau of Indian Affairs | Office of Economic Opportunity |

With so many agencies conducting vocational education it is necessary to pool resources and avoid duplication of effort, waste of materials and misuse of valuable personnel. The length of this list demonstrates the need for coordination among the various agencies.

EVENING ADULT EDUCATION

Adult education classes offered in conjunction with the high schools and conducted mainly during evenings, are designed to update or upgrade already existing skills. Many of the courses offered, such as ceramics, sewing, typing and others, are more accurately defined as avocational.

Table 3[7] shows the status of the adult evening vocational education program in 1966-67. Fifty per cent of the total adult enrollment occurs in home economics supplementary courses, and most are of a practical homemaking or avocational arts nature. These courses account for 80 per cent of the total adult supplementary vocational education program.

Vocational agriculture had 39 programs in 1966 enrolling 1,238 adults (77 per cent of the total adult preparatory program). This is one of the most extensive programs in the state. Forty-three of North Dakota's 53 counties, ranging across the entire state, have at least one adult vocational agriculture program in operation.

The only other programs enrolling a sizable number of adults are

---

| Office | 5 | 532 | 25 | 5 | 21 | 342 | 207 | | 42 |
| Technical | 2 | 588 | 36 | | | | | | |
| Trade and Industrial | 2 | 820 | 54 | | 10 | | 612 | | 58 |
| TOTAL | 14 | 2334 | 143 | 11 | 84 | 1580 | 4338 | 2 | 221 |

those of trade and industrial education and office education. The trade and industrial program has a supplementary enrollment of 612, while the office education program has a supplementary enrollment of 207 and a preparatory program enrollment of 342 (preparatory programs are designed to adequately prepare adults for gainful employment rather than to supplement already existing skills and abilities).

POST-HIGH SCHOOL PROGRAMS

The course offerings at the post-high school level are presented in Table 4.[8] All of the post-high school academic institutions offering vocational education are listed. Those courses designated by an "A" are those offered specifically for the adult population. These people are not full-time students. The "PS" (post-high school) designation indicates courses available at the various institutions for students enrolled full time.

In addition to the programs listed in Table 4, the State School of Science has the following programs available:[9]

| Post-Secondary | Adult |
|---|---|
| Auto Body Repair | Air Conditioning |
| Diesel Tractor Mechanic | Asbestos Worker |
| General Repair Mechanic | Basic and Advanced Arc Welding |
| Machinist | Basic Agriculture Hydraulics |
| Job Printer | Basic Engine Tune-Up |
| Radio, TV & Appliance Repair | Carpenter and Painter |
| Sheet Metal Worker | Color TV Servicing |
| Welding | Electrician |

---

[8]The information in Table 4 was obtained from the catalogs of the various institutions, the 1967 Annual Descriptive and Statistical Report of the State Board for Vocational Education and the Revised Edition of the 1967 Directory of Post-High School and Adult Vocational Training Opportunities in North Dakota, State Board for Vocational Education.

[9]Trade and Industrial Education, Annual Descriptive Report for Fiscal 1966-67.

Plumbing
Architectural Drafting & Estimating
Civil Technology
Electrical Technology
Electrical-Electronics Drafting
Electronics Technology
Industrial & Design Technology
Refrigeration & Air Conditioning Technology
Dental Hygienist
Electrical Motor Repair
Fireman
Fishery
L.P. Gas and Oil Burner Service
Machine Shop
Plumber
Sheet Metal Worker
Slide Rule and Perspective Drawing
Telephone Worker
Transistor Radio Servicing
Supervisory Training

Three additional courses at UND-Williston not included in Table 4 are advertising, management and salesmanship.

As Table 4 indicates, most of the available programs are located at the State School of Science and Lake Region Junior College. These two schools have been designated by the State Board for Vocational Education as Post-High School Area Vocational Schools.

## SUPPLEMENTARY PROGRAMS

### MANPOWER DEVELOPMENT TRAINING PROGRAMS

An important supplementary program is the Manpower Development Training Program instituted by Federal Legislation in 1962. The program is intended as a training and retraining program for both the unemployed and the underemployed. The program began in North Dakota in August, 1962; by 1965, 882 individuals were enrolled for training in 19 different occupations. As of December, 1966, 400 persons were enrolled,[10] the majority being trained as auto mechanics, practical nurses, bookkeepers, office clerks and secretaries. Additional categories for which people are being or have been trained are engineering aide, radio-TV repairmen,

auto body, electrical appliances, small engines, office machine repair and farm mechanics.

Another part of the Manpower Development Training Program is the Pre-Vocational Training Center located at Bismarck. Many of the trainees coming into this program, most of whom are from out-of-state, are drop-outs with below 9th grade basic skills. These trainees receive training in basic skills in addition to pre-vocational training or exploratory activities.

RURAL AREA REDEVELOPMENT

The Rural Area Redevelopment program is a supplementary training program. Under the continuing operations at Belcourt, New Town, Medora, Twin Buttes and White Shield, men are trained for eight weeks in the housebuilding trades of carpentry, bricklaying, sheet metal, plumbing, electrical, and painting.[11] There were 48 trainees in this program in 1966.

JOB CORPS

Another area of vocational education which has come to the fore through the efforts of Federal Legislation in providing opportunities for the disadvantaged is the Job Corps. There are two Job Corps centers, one in Bismarck and one in Dickinson.[12]

The capacity of the Lewis and Clark Job Corps Center at Bismarck is 200 and operates at or near capacity. A general academic curriculum

---

[11] Ibid.

[12] Ibid.

is offered to update existing fundamental academic skills and help students to develop basic communication skills such as reading, writing and speaking. Emphasis is also placed on work attitudes, job appearance and conduct. The Lewis and Clark Job Center has programs in the following seven areas: automotive, clinical, medical (these two are technological assistance areas), culinary, construction, maintenance and conservation.

The second Job Corps Center, located at Dickinson, has a capacity of 120 and is expected to expand to 180. There is again a basic education program to help students improve their langauge and communication skills. The specific vocational programs offered are agricultural occupations, ranching and related occupations, construction occupations, and culinary food preparation.

LABOR UNIONS

Labor unions and employers also sponsor training and up-dating programs. A questionnaire survey conducted by the RCU in North Dakota in 1967[13] indicates that on-the-job training programs of short duration conducted by employers are a major source of short-term training and education for a substantial number of employees. Most of the programs are veryshort and designed to cover one specific job, thus helping many unskilled or semi-skilled workers to hold a present job; however, an updating or supplementary type of program is needed here.

Almost all the labor union locals responding to the questionnaire

---

[13] Labor Union Survey: Preliminary Report, CRVTE, University of North Dakota.

indicated that they had no entrance requirements and very few, if any, extensive training programs for their members. A small percentage (approximately 15 per cent) reported some formal training program in existence. Returns from trade groups traditionally having strong

TABLE 5

NORTH DAKOTA PRIVATE VOCATIONAL SCHOOL ENROLLMENT 1965-66

| Type of School | #of Schools | Enrollment Males | Females | Total |
|---|---|---|---|---|
| Barber | 1 | 25 | 0 | 25 |
| Hairstyling | 8 | 38 | 455 | 493 |
| Business | 5 | 593 | 853 | 1446 |
| Data Processing | 1 | 184 | 46 | 230 |
| Mechanical | 1 | 365 | 0 | 365 |
| TOTALS | 16 | 1205 | 1354 | 2559 |

apprenticeship programs were too sparse to enable accurate conclusions to be drawn. Almost all responding groups expressed interest in complementary formal, school/on-the-job training for employees.

PRIVATE VOCATIONAL SCHOOLS

In addition to the public vocational schools there are 16 private vocational schools in North Dakota.[14] The 1965-66 total enrollment of these schools was 2,559. These schools are mostly in the

[14] Private Vocational Schools in North Dakota, Research Report No. 3, CRVTE, University of North Dakota, 1966.

eastern half of the state with seven of the schools in Fargo, three in Grand Forks, one in Jamestown, three in Bismarck, and two in Minot. The 16 schools represent only five occupational areas. Table 5 presents enrollment figures for these areas.

As Table 5 indicates, hairstyling and business schools are the most numerous with the highest enrollment. Two additional schools have opened: a business school in Jamestown and a hairstyling school in Minot. The schools are increasing in enrollment at a high rate (40 per cent in the period 1962-1965), providing more vocational training opportunities for an increasing number of youth.

In addition to the private vocational schools, there are several institutions and businesses within the state that train personnel for specific occupations. One area of training opportunities available from these sources is that of practical nursing. Programs varying from one to three years in length are available from two hospitals in Bismarck and Minot, one in Bottineau, Dickinson, Fargo and Grand Forks. The other area of training concerns pilot training and related aviation courses. Flying services in Bismarck, Bowman, Devils Lake, Dickinson, Fargo, Grafton, Jamestown, and Minot offer programs in both private and commerical pilot training as well as courses in maintenance.[15]

ANCILLARY SERVICES

Ancillary is a term which indicates all those services which assist or supplement the existing program of vocational education

---

[15]Revised Edition of the 1967 Directory of Post-High School and Adult Vocational Training Opportunities in North Dakota.

offering assistance and information leading to a more comprehensive and adequate total program. These services play a supportive role but are not a direct part of the vocational education institution.

Supervisory assistance from the State Board for Vocational Education provided by the state supervisor of each of the vocational service areas, consists of supervision, direction and leadership in addition to suggestions and assistance in the implementation of necessary changes.

Consultative services are also provided by the state staff. In addition to these people, professional persons often serve in a consultative role when their particular knowlege and skills are needed. The RCU at the University of North Dakota also serves in a consultative capacity.

The other major segment of ancillary services is the research function. Research, both of an experimental and evaluative nature, is essential to an adequate program of vocational education.

Local studies conducted by people actually involved in the programs in the local school training programs constitute one variety of research. Allied with such studies are the efforts of university people conducting research from their various agencies. These two categories of researchers are complementary and they should be encouraged to expand their efforts.

The other major research resource is the Research Coordinating Unit at the University of North Dakota. The RCU functions as the research arm of the State Board for Vocational Education. In this role

it not only conducts its own research but aids others who are planning vocational education research. It also serves as a coordination and dissemination unit for research, collecting, coordinating and disseminating research material on local, state, and national levels of value to vocational educators. The RCU maintains an expanding library of vocational education research information that is available on a statewide level. Through the RCU, vocational educators in North Dakota have at their disposal a wide range of relevant and current research necessary for the effective operation of their various programs.

# Chapter III

## EMPLOYMENT OPPORTUNITIES AND TRAINING NEEDS

### NATIONAL AND REGIONAL PERSPECTIVE[1]

#### POPULATION

The Upper Midwest region, which includes Montana, North and South Dakota, Minnesota, northwestern Wisconsin, and upper Michigan, like most other major agricultural areas in America, has long been a population exporter. Many people who move from the farm and rural areas of the Upper Midwest are absorbed within the cities and towns of the region but since a substantial number, particularly young people, move elsewhere, the region's total population is increasing at less than half the national rate. About two migrants move to this region for every three who leave. This trend has been accentuated in the past three decades by rapidly advancing farm technology and mechanization which permit substantial reductions in the numbers of farms through consolidation. This process releases a steady flow of farm families from the land, augmenting the traditional flow of farm youth.

This migration of people from the Upper Midwest, which has gone

---

[1]Unless otherwise stated, information concerning the region was taken from the following three reports: Migration and Population Growth in the Upper Midwest: 1930 - 1960. Study Paper No. 4 (July, 1962); Education and the Upper Midwest Economies, Technical Paper No. 9 (January, 1964); Population Mobility in the Upper Midwest, Urban Report No. 6 (May, 1964). All three papers are published by the Upper Midwest Economic Study (UMES), University of Minnesota.

on for decades, is expected to continue but at a slightly reduced rate. This large pool of young people represents the region's greatest natural resource, that of an abundant labor supply, for accelerating future growth.

EDUCATION

There are several major educational challenges facing the region. One is that the Upper Midwest has heavy out-migration which is only partly absorbed by its own cities and thus faces the problem of losing trained personnel to states outside the region. The per capita personal incomes of the four full states of the region are below the national average, partly because of the comparatively low percentage of working age population in the region which situation is intensified by heavy out-migration of young, better educated and therefore more highly paid adults. Consequently, the Upper Midwest has a heavier-than-average education work-load with fewer-than-average financial resources. Teachers' salaries are markedly low in the rural schools of the region and the percentage of teachers with college degrees is considerably below the national average. Pupil-teacher ratios in the region are below the national average of 25.7 pupils per teacher. While high ratios reflect considerable overcrowding, the region's relatively low ratios indicate a need for school district reorganization and school consolidation. School taxes of the 304 counties of the Upper Midwest show wide variation, suggesting correspondingly wide variation in educational opportunity

within the region. Regional projections indicate that primary and secondary school enrollments are likely to increase markedly by 1975. North Dakota, however, is expected to contribute relatively little to this increase.[2] The resultant increases in faculty and staff in the face of competition for highly-trained individuals suggests a sizable increase in education costs.

EMPLOYMENT

Dramatic redistributions of employment among various sectors of the national economy have occurred in the past decade. For example, employment in railroads, lumber products and mining has experienced rapid decline both in terms of the percentage employed and the number of job openings. Conversely, state and local government services were among the fastest growing employers of personnel. Manufacturing and mining employment has been relatively slow in growth due to the combined effects of increased automation, a relative shift of consumer demand toward services, and increased governmental activity.

Projections of the national labor force to 1980 indicate an ever-increasing growth rate. The main source of such manpower is the major influx into the work force of young people born in the post-World War II "baby boom". Table 6 illustrates the projected employment changes by major industries.

Table 7 shows projections of employment opportunities to 1975 within major occupations.

---

[2]Educational Development for North Dakota: 1967 - 1975, The North Dakota Statewide Study of Education, 1967, University of North Dakota, Grand Forks.

According to the 1967 Manpower Report of the President, America is completing the sixth year of a period of economic growth unprecedented in magnitude and duration. Staffing this sustained economic expansion has involved greatly increased manpower requirements with a consequent record rise in employment levels. Such levels are mounting faster than

TABLE 6

the total labor force and are leading to a steady decline in unemployment. Yet, the nation faces potentially critical shortages in certain skill occupations while large numbers of disadvantaged and untrained workers remain idle.

One of the most important implications emerging from the occupational projections seen in Tables 6 and 7 concerns the education of

workers.[3] The projected changes in the occupational structure of the work force confirm the findings of previous Department of Labor studies with respect to the generally rising demand for workers with a high level of education and training and the relative diminishment of opportunities for the less skilled and less educated. The need for education and skill upgrading won't be confined to the rapidly growing professional and technical fields nor even to white-collar employment generally. In every broad occupational group, the requirement seems to be for more and more education and training. In fact, employers' demands for better trained personnel appears to be insatiable. Continued advances in the educational attainment and skills of the work force are therefore absolutely essential.

In terms of the number of farm and ranch operators and laborers, agriculture's share in the total civilian labor force declined sharply between 1950 and 1960 - from 26 to 17 per cent in the Upper Midwest (the corresponding national decline was from 12 to 6 per cent). Nevertheless, agriculture's share remains impressively large in many parts of the region, accounting for nearly a third of the labor force in the Dakotas in 1960.

This influence of farms on the structure of regional employment is clearly revealed by the unusually large number of jobs in several Upper Midwest nonfarm employment sectors - jobs which exist to serve the region's agriculture. It follows that employment prospects in these nonfarm sectors will be heavily influenced by what happens in the region's agricultural industry.

An area's manufacturing employment growth is influenced by the

---

[3]Manpower Report of the President, 1965.

particular manufacturing industries in which it specializes. An area's economy based on nationally declining industries has less opportunity for growth, therefore, than an area based on rapidly expanding industries. The Upper Midwest is still closely tied to the sectors of agriculture, mining and other resource-oriented industries all of which have been characterized nationally by slow growth or decline.

With the exception of Minnesota, total earnings (earnings per employee multiplied by number of employees) of the Upper Midwest's component states and part-states grew at a rate below that of the nation between 1950 and 1960. This was a natural corollary to the region's less-than-national average increase in total employment.

In terms of average earnings per employee, the region's states again had less than the national average rates of increase from 1950 to 1960, the most probable explanations being that the region's employment structure is weighted toward the relatively low-wage trade, service and state and local government sectors and that rural out-migrants, who tend to accept lower wages, apply substantial supply pressure on the labor markets.

## NORTH DAKOTA PERSPECTIVE

### POPULATION

Based on census projections of past patterns and processes, the total population of North Dakota (including members of the Armed Forces stationed in the state) can be expected to grow at an average annual rate of about three-quarters of one per cent[4] from 1970 until 1985.

---

[4]Population Estimates: Illustrative Projections of the Population of States: 1970 - 1985 (Revised). Series P-25, No. 362, March 7, 1967.

Table 8 gives the state's projected population, in thousands, by age and sex from 1970 to 1985.

Perhaps the most important trend to be seen in Table 8 is that of the relatively slow growth rate of the "under 18" group until 1975, presaging a "breathing space" for the state in which to strengthen present programs and initiate new ones for the education of youth.

Shifts in within-state population, some reflecting national and regional trends, may also be tentatively forecast.[5] The rural-to-urban migration is expected to continue, although this tendancy may in fact be weakening or even reversing its direction, according to recent national figures cited by Secretary of Agriculture Orville Freeman.[6] The increase in commuting via private auto is expected to bring more rural areas and small towns within an expanding radius of job opportunities in addition to checking the population flow from farm to city. Although future employment growth of the state will occur primarily in the larger urban areas, the small town within commuting distance is in little danger of extinction because of the increase in commuting to job centers as a substitute for migration and the need of farmers for a convenience center located in the more isolated areas.[7]

The results of two recent studies conducted by the RCU bear upon

migration in North Dakota. In the first study,[8] a sample of people who migrated from Walsh County were studied. The most important findings were that most of those who left the county did so mainly because of a lack of job opportunities, low income, and lack of job alternatives. The

second[9] study investigated the relation between senior high school boys' desire to migrate and such other variables as the perceived social cost of migration, attitude toward the community, and their current percep-

[8]Migration Patterns and Selected Characteristics of Migrants From Walsh County, North Dakota, Research Report No. 4 (December, 1966), CRVTE, University of North Dakota.

[9]The Migration Aspirations of North Dakota Senior Males, Research Report No. 7 (August, 1967), CRVTE, University of North Dakota.

tions of occupational choice. The findings indicated a need for additional trained vocational counselors and more occupational information to be provided for the direction of young potential migrants toward relevant and needed job-skill training.

EDUCATION

A detailed analysis[10] of the state's educational system has confirmed the projection of a relatively static school population during the next decade. As noted before, this fact will give North Dakota time to achieve excellence in its schools without having to concentrate on sheer expansion of the school system. According to this analysis, the challenge facing the state is primarily that of providing small-school pupils with an education on a qualitative par with that provided students in urban school systems. In terms of vocational education, this will mean a systematic program of vocational guidance and occupational information beginning in the primary grades, offering an increased variety of relevant vocational courses at the high school level, and encouraging at least a minimal amount of practical vocational experience for each high school student, regardless of his curricular "track".

A recent study[11] cataloged by means of a questionnaire the plans and aspirations of 3,681 North Dakota high school seniors for post-high

---

[10] Educational Development for North Dakota: 1967 - 1975, The North Dakota Statewide Study of Education, 1967, University of North Dakota.

[11] The Educational and Vocational Plans of North Dakota High School Seniors, Research Report No. 11, (In Preparation), CRVTE, University of North Dakota.

school education, training and employment. Regarding post-high school plans, 75 per cent of the seniors indicated they planned to continue their education beyond the high school level. Of these, 19 per cent expressed plans toward attending some type of post-high school vocational school. Forty-eight per cent of all the seniors expressed interest in at least one post-high school vocational course.

A second study[12] was made of the parents of the 3,681 seniors mentioned above. One-half of the senior's parents thought more vocational courses should be offered at the high school level. Only one-third of the parents were satisfied with the adequacy of the local vocational education training facilities. Fifty-four per cent stated that they would like to see their children obtain post-high school vocational training.

Summarizing the implications of these two studies, it appears that both the young people and their parents recognize the practicality of vocational education and hope for increased opportunities for such training at the high school and post-high school level.

EMPLOYMENT[13]

The total population in North Dakota grew by 2.6 per cent during the decade 1950 - 60, despite rural out-migration of which only one-eighth could be absorbed by the state's relatively small urban base. At

---

[12] A Survey of Parents of North Dakota High School Students Who Were Seniors in 1966, Research Report No. 6, CRVTE, University of North Dakota.

[13] The information contained in this section has been paraphrased from a state summary (Pp. 35-36) in Employment and Earnings in the Upper Midwest: 1950 - 1960, Study Paper No. 5 (December, 1962), UMES, University of Minnesota.

the same time, the urban population grew by one-third and nonagricultural employment increased by nearly 16 per cent.

With only 35 per cent of its population in urban areas in 1960, nonagricultural employment is concentrated in activities that service the larger rural population. Almost 40 per cent of the total is in trade and personal and business services, compared with 29 per cent nationally; conversely, only about 4 per cent is in manufacturing and half of this figure is in food products processing.

Wholesale and retail trade increased by only five per cent, paralling the slow population growth; however, personal and business services grew by almost 50 per cent, and finance, insurance, and real estate grew by nearly 40 per cent. Railroad employment a heavy specialty of this state, was reduced by 2,500 jobs (31 per cent). Other declines were in lignite mining (40 per cent) and meat packing (79 per cent).

Government agencies directly provided over one-fifth of all nonfarm jobs in 1960. Federal government employment within the state grew almost three times as fast as the national rate; state government grew slightly less rapidly than in the nation; but in contrast to national trends, local government grew by 16 per cent (only one-third the national rate) compared to the state's urban population growth of 33 per cent.

Average earnings in 1960 were $4,026 or about 15 per cent below the national average, compared with a national-state difference of 11 per cent in 1950. Less than half of this difference is attributable

to the large weight of traditionally low-wage employment. Other factors are the greater seasonal variations (and hence fewer working days per year) and perhaps the effect of the large supply of migrant labor.

EMPLOYER SURVEY

Early in 1966, the RCU undertook a broad survey designed to gather information about employers' vocational needs and opinions about vocational education programs. The purpose of the study was to aid in planning for the kinds of manpower training and community development programs most needed to bolster the economy of North Dakota.

The survey included the cities of Abercrombie, Devils Lake, Grand Forks, Hebron, Jamestown, Lidgerwood, Lisbon, Litchville, Valley City, Wahpeton, Westhope, Williston, and Wing. Within each city, a sample of businesses employing four or more workers was obtained. A self-administering questionnaire was then presented to each selected employer by a member of a local cooperating organization, usually the Chamber of Commerce, which had been asked to provide such personal contact. The questionnaire consisted basically of items asking for selected descriptive data about specific job titles plus information common to all of a firm's employees. Employers were asked to merely check appropriate items and make brief written responses. The total number of returned completed questionnaires was 294.

For our purposes, only those items dealing with the broad topic of vocational education will be considered. To begin with, 54 per cent

of the employers felt that there was a definite need for pre-job experience in most occupations; however, two-thirds of the job titles (e.g., secretary-receptionist, bookkeeper-accountant, clerical worker, business manager, sales clerk) mentioned by the employers were not included in the vocational education program in local schools. Therefore, from these two items, it appears that although employers would prefer at least some minimal amount of training and experience prior to hiring, there is little such prior training available, at least from local schools.

When asked to check occupations for which their experience indicated training was most needed to provide better qualified workers, employers replied that over one-third of the total number of job titles fell into this category. This finding suggests a need for better quality pre-job training for a variety of jobs. In response to an item which asked for identification of areas of training which would help to qualify individuals for present or future employment in their firm, the most frequently checked areas were those of bookkeeping, clerical training, accounting, and especially sales training. This latter choice suggested the need for distributive education courses at the high school level where such pre-job practical experience can be most efficiently obtained.

Perhaps the most striking evidence in favor of increased development of vocational education is found in employers' responses to the item asking them to specify modifications, improvements, or additions which they would recommend in the current trade, industrial, and vocational courses offered in high schools, trade or technical schools, colleges

and universities, and adult education for job-related skills. In addition to the expected listing of their firms' special work-skills, numerous mentions were made of adding more "business" courses and "practical" courses at the high school and trade/technical school level.

The picture thus obtained of employers' needs in terms of vocational education is that of one where more practical and directly relevant applied courses are added at the high chool and post-high school level in order to insure more potential employees at a higher initial level of job-skills. It is evident that employers are aware of various skill shortages and can be relied upon to support efforts for increasing the depth and scope of vocational education in the state.

# Chapter IV

# CONCLUSIONS AND RECOMMENDATIONS

## Conclusions

Any attempt to appraise the adequacy of the vocational education program in North Dakota must, of course, be concerned with both the quantitative and qualitative aspects of the program. In Chapter II, the quantitative aspects of the program were presented and analyzed in considerable detail.

The qualitative aspects of the program were by no means as easy to determine or to evaluate. Any study designed to evaluate the qualitative aspects of such a broad and comprehensive program is necessarily limited in its coverage and validity; the present study did not attempt such an analysis. The research staff members, however, believe that the following statements present an accurate picture of the qualitative aspects of the vocational and technical program in North Dakota.

How well are student needs served by the programs of instruction offered? This is a reasonable and proper question; perhaps in the final analysis it can be answered only by the types of research efforts which would generally be classified as follow-up studies. A great deal of work is still needed in the State of North Dakota in the area of follow-up studies of vocational education graduates. Studies con-

ducted on a state and national level have generally found that vocational graduates obtained their jobs more quickly and easily than did academic graduates. Additional findings indicate that vocational graduates have a significantly greater degree of employment security and are as well educated generally as those persons who graduated from an academic curriculum. The most important point, however, may be the fact that every study conducted has shown that there is a significantly lower percentage of unemployed among the vocational graduates than among graduates from academic curriculum.

The true test of a vocational education program in any state is how well the graduates of those programs succeed in the world of work. It is the considered opinion of the researchers who conducted this study that there exists among the graduates and dropouts of vocational education programs in North Dakota a great amount of job stability and a very low degree of unemployment.

How diverse are the vocational education programs at the high school, junior college, and adult level? The vocational education programs as they now exist in North Dakota include the traditional occupations. There is very little evidence that research studies have been conducted in order to identify and develop the new, the unique, or pioneering programs which may include one or more of the traditional programs. There is definite need to identify and develop programs which will train candidates for some of the new and unique occupations that have evolved in recent years.

Are the teachers adequately prepared and is there an adequate

supply of teachers available for the vocational programs in North Dakota? It appears on the basis of the success of the present programs that vocational education teachers in North Dakota are adequately prepared. Evidence based on personal interviews, indicates that when compared with non-vocational teachers, the vocational teachers have a deeper understanding of and involvement with their communities and a greater personal dedication to the development of vocational skills among their students.

The question of adequate numbers of vocational teachers, although quantitative, will be treated here since it relates closely to the preparation of teachers. There are shortages of teachers in almost every phase of education and there most certainly is a shortage of vocational education teachers in the State of North Dakota. Without exception, every field of vocational education has experienced considerable and increasing shortages in each of the past few years. If the quality of the state's vocational education teachers is to be maintained and the number of vocational offerings increased, it will be essential to provide teacher education facilities, funds, and personnel necessary to prepare an increasing number of vocational teachers.

Any analysis of vocational education in North Dakota cannot escape the generalization that vocational education needs improvement in the areas of organization, coordination and articulation. Its organization is characterized by a multiplicity of institutions under widely varying methods of control and financing. Its lack of coordination is evidenced by a lack of some uniformity in programs and system-

atic means for reaching all the students who need its varying programs. Its lack of articulation is evidenced by little continuity from elementary, to high school, to post-high school and junior college programs.

In summary, the vocational education program in North Dakota is not adequate for the present needs of its people. What has been done in the past, particularly in the past two years, is certainly commendable. What has been done has been done well and represents a considerable effort; what is left undone presents a great challenge.

Recommendations

On the basis of the findings of this study which was conducted at the request of the State Board for Vocational Education, the following steps are recommended for the continued growth and expansion of a viable program of vocational education in North Dakota:

1. Education for teachers of vocational subjects. An increased effort must be made to support an expanding program of teacher education for North Dakota. There is a need to prepare additional teachers in each of the presently established vocational areas, and, in addition, teachers need to be prepared for those occupational areas which will develop. Additional counselors with vocational background and training should be prepared.

2. Organization for administration and supervision. It is recommended that the present Department of Vocational/Technical Education be reorganized and expanded. Vigorous and dynamic leadership at the state level is essential to an efficient expanding system of occupational education. The present Occupational Specialists (State Supervisors) need additional supportive help in order that they can provide assistance in the development of instructional materials, curricula, programs and program evaluation that is needed by high school and post-high school institutions. Additional professional assistance is also needed in the areas of adult vocational education, area vocational school development (including secondary and post-secondary), programs for persons with special needs, health occupations, and research and development. Salary schedules need to be developed which will attract and hold persons competent to do the assigned tasks and merit the respect of the field persons with whom they must work.

3. Research. It is further recommended that a research section be developed within the Department of Vocational/Technical Education for the expressed purpose of making evaluation studies, the review and dissemination of significant studies made in other states and to inform the public and professional educators of the successes and failure of specific activities in vocational education. Such a research section could contribute greatly to the development of new vocational education programs. Such things as conducting pilot studies or evaluating and conducting experimental studies would fall within the realm of such a research and development section. A

logical organization to service this purpose is the already established Research Coordinating Unit located at the University of North Dakota. Additional funds will be required to maintain the system of needed research and development.

4. High school program. Existing high school vocational programs must be expanded to serve a larger enrollment. The present programs are good, but they do not reach enough people. Certainly more than 12.1 per cent of North Dakota's high school students can profit from education experiences specifically designed to prepare them for gainful employment.

5. Post-high school program. It is recommended that post-high school vocational/technical programs be established in conjunction with existing junior colleges or state colleges. The research staff believes that the development of area vocational/technical schools within or as part of area junior colleges will result in a lower total cost and a more rapid establishment of the much needed vocational programs.

   Each area vocational/technical school should develop programs suitable to its particular area. They should all develop as many and as wide a variety of programs as can be adequately staffed and administered, providing there are sufficient numbers of students who wish to enroll in the courses. There must be a statewide agency to coordinate the establishment of specific programs at each of the area schools. Logically, the State Board for Vocational Education would provide such a service. The courses of instruction offered in the area of post-secondary schools should be coordinated with the existing publicly supported high schools in that area. In many cases, the high school vocational programs will serve as preparatory courses for the programs offered in the post-high school institutions.

6. Vocational and technical education for employed youth and adults. Additional programs are needed for upgrading and retraining persons who are presently employed but whose skills are limited. These persons need and desire opportunities to learn new skills which will allow them to move upward in the job market. Such programs should be an integral part of both the high school and post-high school vocational offerings.

7. Vocational and technical education for persons with special needs. It is recommended that the overall program take cognizance of the social and economic importance of vocational education for people unable to meet entrance standards for normal vocational education programs. At present, there are approximately 2,000 disadvantaged youths under the age

of 22 in North Dakota[1] for whom the State of North Dakota should provide the type of training which will enable them to become useful and productive citizens.

It is further recommended that the state coordinate the federal activities of the Manpower Development and Training Act, the Economic Opportunity Act and the Elementary and Secondary Education Act, where applicable, to develop and operate programs for persons not now receiving satisfactory vocational education services in the public schools. It is further recommended that the State Board for Vocational Education give considerable emphasis to providing the means for coordinating these activities with other vocational education activities in the state.

8. Administration and financing. Finally, both professional and lay leaders in the state, and legislators, must find more efficient ways of administering and financing vocational education in North Dakota. Both young people and adults cannot get in the future, as they have not in the past, the kind and amount of vocational/technical education they need unless local school boards, the State Board for Vocational Education, and the Board of Higher Education maintain a continuing liasion and develop a cooperative working relationship.

IOWA

Titles of contract research and abstracts of master's theses and doctoral dissertations, completed between 1960 and 1967, are presented. Most of the research was done at the three state universities and one private university, Drake University, Des Moines, Iowa. The 329 items are listed in a content index by author, year, and Iowa Research Coordinating Unit publication number and abstract number. The title index, alphabetized by author, includes the same information in addition to the title, the degree level of the author or name of the contract agency, the university, and the date of completion. A subject index provides abstract numbers under 32 area headings. Some of the areas are administration, adult education, building and equipment, business education, community resources, evaluation, guidance, student interests, teacher education, and trade and industry. # I N T R O D U C T I O N

The Iowa RCU has developed this selected bibliography of Iowa research in Vocational-Technical Education and related areas for the years between 1960 and 1967. Contract research as well as abstracts of masters theses and doctoral dissertations are included. For the most part, these abstracts have been gleaned from research at the three state universities and one private university, Drake University, Des Moines, Iowa.

The Contents page lists the authors alphabetically; however, the subject index appears at the back of this publication.

Many Iowa 4(a) projects are still in process. It is planned to include listings of the abstracts of these final reports in future supplements. Meanwhile, your additions to this bibliography, plus any corrections, will be welcomed by the Iowa RCU staff.

Crisis in the Fire Service, the Educational Dimension.

International Fire Administration Institute, Albany, N.Y.
New York State Univ., Albany. Center for Executive Development
MF AVAILABLE IN VT-ERIC SET.
Pub Date - 26Oct67 14p.; Speech delivered to the Committee on Fire Research, National Research Council at the National Academy of Sciences (Washington, D.C., October 26, 1967).

*SPEECHES; *FIRE SERVICE; *EDUCATIONAL NEEDS; CONTINUATION EDUCATION; *EDUCATIONAL PROBLEMS; PROGRAM IMPROVEMENT; TECHNOLOGICAL ADVANCEMENT; *FIRE SCIENCE EDUCATION; INTERNATIONAL ORGANIZATION

In 1957, the International Association of Fire Chiefs called for the creation of an educational institute which would be concerned with professional and educational development of fire service personnel. In 1958, the International Fire Administration Institute was incorporated by The Board of Regents of The University of the State of New York. The objectives of the Institute are to engage in research, to obtain, prepare, and distribute materials and courses of study in fire administration and related subjects,and to give assistance by grants or scholarships to students in the field of fire administration. In 1964, affiliation with the State University of New York at Albany enabled the Institute to broaden its activities and to utilize the resources of a multi-purpose university. The rapid changes and advances in knowledge, the swift obsolescence of techniques in vocational and professional careers, and the challenging and complex manpower utilization problems all have combined to place a new importance on education. Powerful currents are flowing toward professionalizing the fire service, and enhancing its educational posture, increasing research efforts, recruiting candidates with greater career potential, and creating a better public image in the community. A number of significant problems are being defined, and solutions must be sought if the fire service is to be staffed with personnel who are technically, conceptually, perceptually, and administratively competent. # CRISIS IN THE FIRE SERVICE

## THE EDUCATIONAL DIMENSION

By

Professor D. F. Favreau

Presented at the

NATIONAL ACADEMY OF SCIENCE
Washington, D. C.
October 26, 1967

I am delighted to be here this morning and I appreciate this opportunity to acquaint you with the ever increasing role of the International Fire Administration Institute in meeting the educational challenge facing the nation's fire service.

At the New Orleans convention of the International Association of Fire Chiefs held in 1957, a motion was passed calling for the creation of an educational institute which would be concerned with professional, educational development of fire service personnel.

On June 27, 1958, the International Fire Administration Institute, sponsored by the International Association of Fire Chiefs, was incorporated by the Board of Regents of the University of the State of New York.

The objectives of the Institute are:

- To engage in research and otherwise obtain material for the preparation of courses of study in fire administration and related subjects and to prepare such courses of study.

- To make such material and courses of study in fire service administration and related subjects available for use by educational institutions, particularly at the college level, in the United States and foreign countries, and to work with and assist educational institutions in the development of such material.

o To give assistance by grants or scholarships to students in the field of fire administration; and to receive funds, grants and gifts for carrying out the objectives of the Institute.

In 1964, the International Fire Administration Institute affiliated with the State University of New York at Albany. This affiliation has enabled the Institute to broaden considerably the scope of its activities and to utilize the resources of a multi-purpose university which has long been concerned with developing administrative leaders. The executive offices of the Institute are located on the campus of the State University of New York at Albany . . . .

Never before in the history of man have changes of such great magnitude and significance been taking place in all aspects of social, economic and spiritual and technological life, in fact, in any given area you wish to identify, and I truly believe we haven't seen anything yet.

If one tries to characterize today's world, it is an era of change, explosive change, subtle change. Everything about you will change and the rate at which these changes will take place will constantly increase.

The rapid changes and advances in knowledge, the swift obsolescence of techniques in vocations and professional careers and the challenging and complex manpower utilization problems all have combined to place a new importance upon education. (An official of the Westinghouse Corp. recently emphasized the need for up-dating the engineer when he pointed out that the engineering graduate of today has a "half life" of about ten years, that is, about half of what he knows now will be obsolete in ten years and half of what he needs to know in ten years is not available to him today).

Consider, if you will, how the time dimension related to flight technology has continually diminished in recent years . . . . . Leonardo Da Vinci designed

a flying machine about 1500, however, some four hundred years elapsed before the Wright Brothers actually succeeded in getting such a machine off the ground and into the air.

Now, in contrast, note what has been achieved in the sophistication of rocket technology. The first liquid fuel rocket took flight in the wintry New Hampshire skies in 1926 . . . . thirty years later in 1957, the Russians fired a shot heard around the world . . . . (the American school and the American school child felt the recoil). Sputnik I was placed in orbit and in less than a decade two American astronauts were rocketed into space, docked, and actually took a stroll.

One of the most fascinating reflections of our time goes to the truth of Victor Hugo's famous maxim: "No army" he wrote, "can withstand the strength of an idea whose time has come."

The super-city of the future is already on the drawing boards. This super-city will need a super fire department, with a super pumper and a super chief. TOMORROW IS ALREADY HERE!

The steady stirring of interest in, and enthusiasm for, systematic and deliberate education programs for the fire service in the past two years has unusual significance. Powerful currents are flowing toward professionalizing the fire service . . . . . toward enhancing the educational posture of the fire service . . . . . toward increasing research efforts . . . . . toward recruiting candidates with greater career potential and toward creating a better public image in the community. The Wingspread Conference in 1966 provided a catalyst in the form of twelve statements of National Significance to the Fire Problem in the United States:

1. Unprecedented demands are being imposed on the fire service by rapid social and technological change.

2. The public is complacent toward the rising trend of life and property by fire.

3. There is a serious lack of communication between the public and the fire service.

4. Behavior patterns of the public have a direct influence on the fire problem.

5. The insurance interest has exerted a strong influence on the organization of the fire service. This dominance seems to be waning. The fire service must provide the leadership in establishing realistic criteria for determining proper levels of fire protection.

6. Professional status begins with education.

7. The scope, degree and depth of the educational requirements for efficient functioning of the fire service must be examined.

8. Increased mobility at the executive level of the fire service will be important to the achievement of professional status.

9. The career development of the fire executive must be systematic and deliberate.

10. Governing bodies and municipal administrators generally do not recognize the need for executive development of the fire officer.

11. Fire service labor and management, municipal officers and administrators must join together if professionalism is to become a reality.

12. The traditional concept that fire protection is strictly a responsibility of local government must be re-examined.

These statements, though broad in scope, focused sharply on the current dynamic educational, technological and socio-economic developments, as well as on administration problems that have developed through the years.

The Wingspread spirit gained momentum at the Saratoga Symposium on Higher Education for the Fire Service, held in the early part of 1967, which focused on Motivation of Fire Service Personnel to Higher Education, Prospectus of Higher Fire Service Education Programs, and the establishment of Curricula Guidelines.

One month later the editors of Fire Engineering Magazine conducted a symposium in Chicago to explore in depth the specifics . . . present and future . . in problem related areas defined by the Wingspread Conference. A summary report of the findings of this symposium entitled, "The 1970's - The Challenging Years for the Fire Service", contained trigger phrases such as Personnel: 'This is the time to accept the challenge' - Recruiting: 'Direct entry at the lieutenant level?' - Labor: 'When the union knocks at your door! . .' - Education: 'Sudden thirst for greater knowledge' - Apparatus: 'Limited only by the imagination' - Federal Government: 'Stronger role' - and were published in the September 1967 issue of the magazine.

During the past few months the fire service has been following with interest and anticipation the progress of the proposed Fire Safety and Research Act of 1967 (S 1124 - H. R. 11284). This legislation requested by President Johnson last February would be part of a "major national effort to reduce our shameful loss of life and property from fire." As you know, Title II of the act proposes the appointment of a National Commission on Fire Prevention and Control to undertake a comprehensive study to determine practical and effective measures for reducing the personal and property toll taken by fires in the United States.

It is written in the Bible, Ecclesiastes, Chapter Three, "For everything there is a season, and time for every purpose under the heavens" . . . . . this

is the season . . . .for the nation's fire service personnel to accept the challenge! We are in the midst of transition which has resulted in a knowledge explosion! . . . . . The two strands of working and learning are intertwined for the length of a fire fighter's career and it is becoming increasingly apparent today that education may well be a life long process . . . . . What are some of the outward dimensions?

Education is America's biggest single enterprise. Out of a population of nearly two hundred million, some fifty-four million Americans are attending formal classes. In 1900, ten percent of the working population was in the professions. Today, the figure is well over twenty-five percent. In 1900, twelve percent of the nation's work force were classified as laborers, today the number has been reduced to five percent. During the past decade for the first time in history, the white collar workers as a group exceeded the number of persons representing the blue collar class and, according to the United States Department of Labor's manpower projection, the trend will continue. By 1970, fifty percent of the nation will be under twenty-five years of age. The projected growth level on higher education enrollments is directly related and most significant, as it is estimated that some nine million students will be enrolled in institutions of higher education by 1975. (The State University of New York will have about 260,000 full time students, spread over its sixty campuses).

The nation's two year colleges in particular, are expanding rapidly, the present enrollment of 800,000 students is expected to almost double by 1974. The two year college holds much promise for those in the fire service seeking post-high school technical training and an academic setting where perhaps he will be motivated to go on to the final two years of college and the bacca-

laureate degree. The high school drop-out is today's lost man; tomorrow's lost men will be the college drop-outs.

The International Fire Administration Institute, responding to hundreds of requests for guidance and educational counseling, conducted a survey of the nation's institutions of higher learning for the purpose of ascertaining the scope of the fire education programs. The survey was completed and the findings published in November, 1966. The demand for this publication has been beyond our expectations and is now in its fifth printing. The publication entitled "Fire Science Technology Curricula Survey" has been sent to fire departments, institutions of higher learning, labor organizations, federal and state agencies, libraries, fire chiefs, deans of academic institutions, and personnel representing various organizational levels of the fire service.

Geographically, the survey has been mailed to thirty-five states, several provinces of Canada, the Republic of the Philippines, Japan, Great Britain and our most recent mailing was to a service man in Viet Nam.

The Fire Science Technology Curricula Survey compiled a selected sampling of Fire Science, Technology and Administrative programs offered by colleges and universities throughout the United States.

The document also points out certain problems which may be encountered in the development and implementation of fire service programs of higher learning and recommends a number of solutions for solving these problems.

The programs offered by two year colleges are Fire Science, Fire Protection Technology, Fire Technology and Administration, Fire Service Administration, Fire Protection Engineering, Fire Protection and Fire Safety Engineering Technology.

The survey disclosed that a semantic swamp exists in curriculum, program

and degree titles. Students in pursuit of higher education in the fire service would find a very limited offering. In the United States today one university awards a Master's degree in Public Administration with a minor in Fire Administration. Two institutions grant the Baccalaureate degree in Engineering and seventy-two schools offer courses leading to Associate degrees, diplomas and certificates of achievement.

If the total number of institutions offering courses in fire education were equally distributed throughout the United States, it would result in less than two schools per state offering such courses. However, the situation is even more alarming when you realize that fifty of the some seventy schools are located within the boundaries of two states. In a period of swift obsolescence of techniques in vocations, fire service personnel in thirty states cannot enroll in programs of higher learning in fire education because such programs do not exist within the boundaries of their state.

This past semester a two year college with fifty students enrolled for the basic course in fire science, cancelled the course because it was not possible to recruit an instructor knowledgeable in firematics and academically acceptable to the college.

These facts confirm a suspicion that the fire service is entering its most severe educational crisis.

A number of other significant educational problems relating to the fire service were defined at the Saratoga Symposium. These would include:

- too much dependence on the assertation of need rather than effective job analysis in the planning of college course work.

- a lack of appropriate standards of curricula.

- minimal systematic and deliberate development of courses designed solely for fire service personnel.

- the incentive of a career fire fighter to pursue an academic program which involves considerable personal sacrifice is thwarted because of archaic civil service laws which place emphasis on seniority and manipulative skills rather than academic achievement.

These problems along with the following provocative questions could provide a framework for an in-depth exploration by officials of the federal and state government, fire executives, labor-management authorities and academicians:

- Upon graduation from college will the new degree equipped graduate of tomorrow consider the fire service as a career?

- What is the fire service doing to attract this caliber of person to consider a fire service career?

- How do you recruit instructors who are knowledgeable in firematics and acceptable to the academic community?

Solutions emerging from these problem solving sessions could be then assigned to a task force for action. A sense of urgency exists - the fire service as we know it will be obsolete in ten years unless it is staffed in depth with personnel who are technically, conceptually, perceptually and administratively competent, and this degree of competency can only be achieved in great part through the continuing education process.

*YOUTH OPPORTUNITY CENTERS

This addendum to the first part of "The Colorado Story" (VT 005 052) describes the second Institute conducted by the University of Colorado for training Youth Opportunity Center personnel. Details of the development and conduct of the program of both institutes are presented in VT 005 052 and some of the modifications and changes resulting from the first experience in Volume II. Program changes included (1) addition of information about the courts and law enforcement, (2) inclusion of businessmen and representatives of the public educational system, (3) provision for contact with welfare officials and opportunity to observe the home environment of youth, and (4) the inclusion of more senior Employment Service personnel in the training program. The lecture, demonstration, and field experience approach was continued. The lectures were: (1) "Economics of War of Poverty" by R.A. Zubrow, (2) "The Establishment" by H.H. Higman, (3) "Cultural Pluralism and the Southwest" by C.S. Knowlton, (4) "The Judge and the Poor" by Ted Rubin, and (5) "The Law and the Poor" by Jim Carrigan. Texts of the lectures and the results of a series of program evaluation questionnaires completed by participants are included. (ET)

# PREFACE

Since the publication in 1964 of the original Colorado Story (Volume I), we have had two years' experience with the attempt of the American society to face the problem of poverty and deprivation in the United States. We have seen these problems clearly linked to inadequacies in our educational institutions from the training in literacy in the lower grades to the training of professionals in the graduate schools. Even the professionals are not equipped with the skills and knowledge and commitment to serve as administrators of the poverty programs.

We have seen the problems of poverty connected to problems of crime in the streets and violence in the urban ghettos. We have seen a public opinion developing an awareness of the threat to the peace and tranquility of our society both by the fact of poverty and the attempt to alleviate it.

Much necessary experimentation and innovation has occurred -- some of it fruitful.

We have seen a sharpening of the inherent conflict between the necessary institutions for social stability and order on the one hand and the increasingly apparent necessity for rapid and extensive social change on the other. Too often one or the other of two unsuccessful dispositions of this conflict has occurred. Many action programs for change have so threatened the established order that they have been abolished or they have been so accomodated to the established order as to be indistinguishable from it, thus not serving to abolish the problems of poverty but rather to massage them.

These failures have been wrongly attributed to a lack of coordination in the poverty programs, ineffective administration, or the interference of local, regional, or national politics.

It is our opinion that too often the thought was, that if the money were appropriated and persons were hired, progress would be achieved. We have observed that, where failure has occurred, the principle cause has been personnel who have been inadequately trained to execute the program.

This manpower shortage, furthermore, will not be solved by merely "more of the same" -- more professionals with graduate degrees stemming from the traditional university curriculum. It is not a quantitative problem but a qualitative one.

Our experience in training VISTA volunteers, Employment Service personnel, and Head Start administrators has shown us that, with a totally specialized training program, persons can acquire both the skills and the orientation to operate successfully in the field. Carefully designed training for every level of staff combined with continuing training, support in the field, and periodic sessions for feedback, evaluation, and retooling is the first requisite for success in this new task. The sociology and public administration of the problems of poverty are new technologies. If Congress is to see more benefit from the funds it appropriates, a larger share of the money will have to be allocated to the development of effective personnel. This may well include the utilization of large numbers of persons presently barbarously referred to as "non-professionals."

The basic format and spirit of our training program is described in the original Volume I of The Colorado Story. No attempt is made here to repeat this description. This volume does not stand alone, but as an addendum to the original volume. Here, we are presenting modifications and changes that were occasioned by experience and including didactic material that trainees found useful.

Howard Higman

COLORADO II

PROGRAM DESIGN

Region Nine of the United States Employment Service and the Employment Security Commission of Wyoming requested the University of Colorado to conduct a second Employment Security Institute on the Management and Operation of Youth Opportunity Centers during the month of February, 1966.

In developing the plan for the second Institute, the staff drew heavily on the suggestions of those who took part in the first Employment Security Institute. The feedback questionnaires completed immediately following the first Institute had supported the basic premises we had made -- that a natural poverty setting using persons from a poverty area as instructors would provide the best learning environment. The participants had also endorsed the idea of an intense round-the-clock three-week program as effective despite the exhaustion they had felt.

lecture

demonstration

In June, 1965, a three-day follow-up meeting was conducted at the Oxford Hotel. At that meeting participants reported that, even six months later, the learning had not worn off. They made some suggestions based on the actual experience of running Youth Opportunity Centers for program improvements. Participants stated that outreach activities -- getting the high school pushout youth into the YOC's -- were no problem now. However, holding onto the youth while they waited for training programs, basic adult education, Job Corps, or other placements was a problem. They suggested that the curriculum be expanded to include additional information about the courts and law enforcement. They wanted more time with the basic instructors and the inclusion of businessmen and representatives of the public educational system in the program. Graduates of Colorado I also suggested more contact with persons administering welfare programs and opportunities to see the home environment of the youth they serve. More contact with employers was also encouraged.

field experience

Finally, participants in Colorado I recommended the inclusion of more senior Employment Service personnel in the training program to increase the understanding of administrators of the program and of the problems of the Youth Opportunity Centers.

The central structure of the Employment Security Institute II continued the focus of Colorado I on a three-phase approach: lecture, demonstration, and field experience. This provided each trainee with the opportunity to test didactic material through classroom demonstrations and field experience.

Because of the time of the year, the Denargo Market experience could not be included, but the rest of the field experiences -- looking for a job, eavesdropping on the middle class, watching the unemployed, riding in squad cars -- were repeated. Some of the information which had been presented through lectures in the first program was translated into field experiences in Colorado II. Trainees visited homes of poverty persons in the company of social caseworkers from the Denver County Welfare Department. They visited the county jail; they surveyed the city for potential jobs for youth; and they listened to businessmen describe their experiences with the type of young persons the Youth Opportunity Center must reach. They also had their day in court to experience what is is like to stand before a judge in behalf of a young man who is having problems with the law.

Space does not permit us to describe all of the field experiences and demonstrations which were presented in The Colorado Story -- the reports of the participants' experiences in riding with the police and in looking for a job were as rich and meaningful as those published previously. Equally rich was the teaching by basic instructors -- unemployed men and women and high school dropout youth -- who were employed to team teach with William T. Adams. But, here we present those field experiences which have not been previously described.

**Counselor for the Defense**

One does not work in a Youth Opportunity Center that is accomplishing the task assigned to the YOC without coming into continual contact with youth who have had constant contact with law enforcement agencies and the courts. This is a fact of life. Youth who come from economically-deprived homes located in poverty areas of the city more frequently get into trouble. Their police record is one of the major factors which causes them difficulty in finding and holding jobs. Even after a counselor has worked with such a youth for some time, has him on the right track, sees great improvement, there is still a better than even chance that the youth will get into trouble. Ten days in jail as a consequence of misbehavior at a Saturday night party may end, once and for all, a young person's chance to make it. Ten days absence from a welding course or a basic adult education program or from his new job may result, in fact usually does result, in the youth losing out -- a dropout from the pushout school.

This brush with the law may be the first mistake the youth has made in six months -- months that have been filled with real progress in the YOC program. The six months preceeding may have included a run-in with the police on a weekly basis. If a judge is aware that a youth is making progress and that someone is interested in him and working with him, the court will frequently give the youth a break. But, someone has to let the judge know that progress has been made. That someone is the Youth Opportunity Center counselor.

But, who does the counselor talk to and what does he say? The answers to this question were the theme of the "Counselor for the Defense" field experience. The trainees were dividied into groups of five and each group was given a basic instructor -- a youth who had been participating in a YOC program and who had made progress, but who had recently violated the law. Each team had an opportunity to spend an evening with their basic instructor reviewing his work history, program progress, police record, and court actions. Following their research into their basic instructor's background, each team decided on the best way to describe the situation to a judge if the opportunity presented itself.

On the following morning, a legal holiday for the state of Colorado, the judge of the juvenile court and his court clerk made a courtroom available. With their basic instructor, using the actual case which had been tried previously -- or in several instances the case which was yet to be adjudicated -- each team spoke as a friend of the court in behalf of the basic instructor. The courtroom was real, the basic instructors were real, and the violations of the law were real. This moot court experience and the evening with the basic instructor were designed to meet the needs expressed by the graduates of the Colorado Employment Security Institute I for some practical experience in dealing with the law and the courts. Trainees reported that their previous reluctance to enter a courtroom in behalf of a youth was reduced or dispelled.

Job Fabrication

One of the frequently heard complaints of Employment Service personnel who work with high school dropout youth who have police records is that the average businessman will not take a chance on high-risk youth who have been in trouble with the law -- that they are in business just to make money.

Is this statement indeed true?

To find out, participants went into the city of Denver to seek jobs for the kinds of youth served by the YOC. Each trainee was assigned a partner and was given a list of three to five employers who were within walking distance of the Oxford Hotel. Instructions included the task of informing the employer of the programs offered by a Youth Opportunity Center as well as other Employment Security programs such as testing, placement, MDTA, and on-the-job training. Further, trainees were asked to prepare a brief report in which they (1) described the chronology of the day's events; (2) gave a brief journalistic description of the interview; and (3) classified the responses of the employer according to an arbitrary scheme offered by the staff.

A word or two about the classification scheme is in order. The categories designed by the staff included a series of polar extreme personality types:

Was the employer you interviewed:

| | | | |
|---|---|---|---|
| an optimist | ( ) | a pessimist | ( ) |
| efficient | ( ) | dignified | ( ) |
| verbal | ( ) | non-verbal | ( ) |
| knowledgeable | ( ) | nonknowledgeable | ( ) |
| humanistic | ( ) | hard-nosed | ( ) |
| listener | ( ) | opinionated | ( ) |
| broad | ( ) | limited | ( ) |
| fearless | ( ) | fearful | ( ) |
| Mustang | ( ) | Silver Spoon | ( ) |

Most of these words are self-explanatory in their usual common sense meanings. "Dignified" refers to the willingness of the employer to engage in ritual courtesies rather than in the more efficient "give me the facts and be on your way." "Mustang" refers to the historical origins of th employer. Is he a person who grew up in the business and made it the hard way or did he inherit the business with little knowledge about how it operates and who he needs to run it?

The reason that this classification scheme was employed was not that the categories have any special scientific significance. Rather, it was our desire to add a new dimension to a task with which most of the trainees were well acquainted. The classification of employers was actually a game -- a game designed to increase the alertness and decrease the nervousness of our trainees as they moved into downtown Denver to interview employers. The game served its purpose, for trainees found the classification exercise interesting and fun.

Below are some of the reports trainees presented following the field experience:

"It was our experience today that when YOC programs are explained to employers, they become interested and, in many cases, want to become involved with the youth. The employers we contacted have been or are working with youth in other organizations not connected with the YOC. Once the YOC program is explained in detail to the employer, he becomes much more interested in helping."

---

"We went directly to a company engaged in manufacturing refrigerating equipment. We did not have an appointment, of course, but were received in a casual though gracious manner. In our discussion with the general manager, who received us in a friendly and interested manner, we learned that this company was in the process of expanding and moving into larger facilities. The company plans to increase its factory force from ten to fifty, mostly skilled workers. In addition, there will be possibilities of placing a number of temporary and unskilled workers to help with the move. After we explained the services available through the Employment Security and Youth Opportunity Centers, including all the facets of training, he agreed to a follow-up contact in two months.

"We found that employer to be: an optimist, efficient, verbal, knowledgeable, a humanist, a listener, broad, fearless, and a Mustang.

"The significance to us of this visit was that the employer was not prejudiced against minority groups or to the poverty programs, but lacked a definite knowledge about them.

"The significance of our second experience was the cross section of minority workers. The employer's oldest employee was a Japanese girl who had been with him nineteen years. Of the two Negro workers, one had been with him fourteen years. He also had an Italian and a Jewish person employed. He has used the Employment Service and asked for a comment on the results, he said: 'Most of them are punks who want to get back on the U.I. roles rather than work.'"

---

"At our first stop, the employer told us that employment was static. It was a three-person operation with no immediate needs. In the conversation of the nature of the business it was brought out that reliable salesmen could be beneficial to the business and that at the present time an additional typist could be used for typing stencils to make a catalog. We called in the orders to the YOC from his establishment. Possibilities of future sales and warehouse personnel were discussed and a follow-up was encouraged.

"At our second place of business, we discussed apprenticeship programs and the possibility of MDTA on-the-job training. The employer was very interested in such a program and asked for further information. The YOC was called and notified of present job openings at this plant.

"We discovered that even in the month of February there are job possibilities. If contacts are made, jobs are there. We feel that contacts should be made by a team rather than by individuals to be more effective."

---

"Our first contact was with an upholstery company. We were well received. The receptionist ushered us into the office manager's office. He was cordial and cooperative. At our second contact, the employer was quite busy, but an appointment was made to return on Wednesday. Our third contact was with a manufacturing company where we were taken into the personnel manager's office immediately. He was pleasant and interested in the services of the Employment Service and of the YOC.

"It was significant to us how well we were received. We were given the time we needed to explain our programs and all of the employers seemed very interested in them. They were willing to consider YOC youth as employees, including those with court records. The employers were aware of the youth employment emphasis and voiced a helping attitude."

---

"Our first visit was made to a small firm dealing in retailing coffee, tea, and spices. It is a small operation consisting of an office clerk and a part-time delivery and stock boy. There is quite a turnover in delivery boys and this could be a potential employer for YOC youth. The employer has kept the brochure received in the mail of the YOC and plans to contact the center in the future. He is favorable to the youth programs and is understanding of youth and their problems. It would be wise for a YOC representative to make another contact soon and increase this employer's limited knowledge of the youth programs.

"The second visit was to a somewhat larger firm which employs eight people. The various program of the YOC were discussed with the employer who knew little about them, although he had been contacted by an Employment Service representative once. His standard procedure for hiring new help was through walk-ins or through friends of his staff. He would try them on the job for a week or two to determine their attitudes and capabilities. The possibility of using test-selected applicants was discussed with him and he was interested and could see the value of this service in reducing training time and turnover. This employer should be re-contacted within the next two months as he plans to hire two or more employees at that time. He seemed favorably inclined to the hiring of minority persons and those with records. He seemed to be liberal with his employees and most of them had been with him a number of years."

---

"Arriving for an interview with the first employer, an employee of the establishment informed us that the owner was busy and could not talk with us. We began explaining our program and the youth for whom we were trying to obtain employment. Apparently the owner was listening to our conversation because he became interested and entered into the discussion. He said that he had received some correspondence from the Youth Opportunity Center and knew about our program and organization. He stated that he was unable to employ anyone because his business was small and that when the occasion did arise he usually employed a disadvantaged Spanish-American female in order that she might remain in school. He mentioned that he had sent one girl through school and had one boy who was not doing his school work although he was doing a good job at work. The employer told the boy that either his school work improved or he would be out of a job.

"The second employer was sympathetic to the whole idea of the Youth Opportunity Center and stated that he would cooperate wholeheartedly when his business improved and he needed employees. The third employer was sympathetic to our program, but stated that he preferred to depend upon friends and relatives for his source of labor supply. The fourth employer was in the process of obtaining a small business loan and said that if he was successful in getting the loan, he would gladly hire three youths. In short, it can be stated that all of the employers contacted were polite, courteous, cooperative, and appeared willing to hire YOC youth."

---

"The owner of the B & P company met us with a great deal of emotion, denouncing all social welfare programs since and including the New Deal. He did listen to our story and when it became apparent to him that it might be advantageous to him to have people trained in his type of business, he told us his employment problems as well as his philosophy. He ended the interview expressing an interest in a training program for tire recappers. This employer was pessimistic, verbal, knowledgeable, hard nosed, opinionated, limited, fearful, and a Mustang. It reinforced my idea that the

majority of businessmen are in business for a profit and that an approach to them must be made in terms of benefits accruing to them."

---

"Our first employer was not too interested at first in anything we had to offer, but he gradually warmed up and explained his operation to us, which was a repair service. We asked him if he would be interested in training any workers and told him of some of the advantages of doing so. After some explanation of appreticeship programs, the employer became very interested and finally gave us an order for a trainee.

"We went to our next employer who was quite busy and at first appeared reluctant to take time out to talk with us. He stated that he did need help and was currently advertising in the paper for a skilled craftsman. We explained the various training programs offered by the YOC and asked him if it would not be feasible for him to train an eager youth who had a desire to learn this skill. After a lengthy discussion, we asked him for a job order for a trainee and we were given an order. The employer was quite enthusiastic with the YOC program after it had been explained to him. He said he was glad we had called and explained it to him as he did not know these services were available to youths or employers.

"We learned from these experiences that if an employer is properly approached and the services available to employers and youths are properly explained, many employers are not only willing to accept trainees, but are willing to go out of their way to help unskilled youths by offering them an opportunity to work and learn while doing so."

---

Trainees returned to the classroom with a sense of exhilaration and excitment. February is a dead month employment-wise. Yet, in three hours thirty-six trainees had found all kinds of job opportunities -- job opportunities for exactly the kinds of youth that the Youth Opportunity Center serves. The phrase "employers are in business just to make money" placed in this new context of practical experience lost some of its cynical ring. Businessmen are in business to make money, but they are also citizens who feel a strong responsibility to the community. Most businessmen are willing to take risks and participate in new kinds of experimental programs if a counselor from the Youth Opportunity Center is willing to share the risk.

Of great importance is the fact that most businessmen are unaware that the counselors of the Youth Opportunity Centers have programs and youth who want a job opportunity. Flyers mailed twice a year help, but the personal contact is essential. Small businessmen do not have rigid standardized procedures for hiring persons. Moreover, the small businessman will frequently take a more personal interest in a youth who is having difficulties in finding and holding a job and may, therefore, be a better placement.

In three hours, trainees interviewed more than one hundred employers and found more than one hundred potential placements. Five placements for Youth Opportunity Center youth were made in the following week. Three immediate placements for adults were found and referrals were made on the same day. The remainder of the potential placements were carefully documented and turned over to the YOC for follow-up.

The Job Fabrication field experience served several purposes. A number of trainees who had never interviewed employers obtained good practical experience in this important assignment. All trainees found that there are job opportunities available, even during the month of February, and that businessmen are willing to participate in the Youth Opportunity Center program.

This experience also lends credence to a mass job fabrication approach effort, with emphasis on small businessmen, in major metropolitan areas. It should be possible if MDTA, on-the-job training programs, and other YOC projects were to coordinate their activities (and this would require the cooperation of officials at the regional and national levels) to find and place several hundred youth in one or two weeks. State Departments of Employment might wish to consider this approach -- the use of teams of men reassigned from their usual jobs for a week or two -- to blanket the small employers and fabricate jobs based on a shared-risk cooperation with local businessmen. Such a program could, in our opinion, prevent a Watts.

Professor Reuben A. Zubrow

Professor Zubrow has been with the Department of Economics at the University of Colorado since 1949. Previously, he taught economics at a high school in Roselee, New Jersey; at Indiana University; and at the Helsinki School of Economics and the Swedish School of Economics in Finland as a Fulbright Professor.

Dr. Zubrow received his B.S. Degree in Business Education at Trenton State College, his M.A. Degree in Economics at the University of Pennsylvania, and his Ph.D. in the same field from Indiana University. His areas of specialization in economics include public finance and fiscal policy, economic theory, and public utilities and industrial organization.

Professor Zubrow has been a consultant to the President's Advisory Commission on Intergovernment Relations since 1961 and served as the Economic Consultant on Taxation to the Governor of Colorado from 1958-1962. He has published numerous articles, books, and monographs on the subject of taxation.

THE ECONOMICS OF THE WAR ON POVERTY

by
Reuben A. Zubrow
Professor of Economics
University of Colorado

I have been given the assignment of placing poverty in the United States in some perspective relative to recent developments in the American economy. At the outset, let me forewarn you that I will have to resort to a good deal of statistical data which I trust will not bore you. We are all aware of the fact that statistics many times are used in a manner which conceal more than they reveal. However, when we deal with an entity as large as the United States, we obviously must use aggregate data if we are to obtain a quantitative profile of the major characteristics of our economy, and particularly of the poverty program.

The United States today may be described as a Galbraithian "Affluent Society." The post-World War II era has been characterized by unprecedented prosperity. It is not an exaggeration to assert that never before in the history of mankind have so many people, at least in an economic sense, fared so well as in the United States today. The high levels of productivity, income, consumption, and employment experienced since 1946 have been greater than that of any comparable period in our history, notwithstanding the fact that during the past two decades we have had four postwar recessions. The first one occurred in 1948 and 1949, which we may call the Truman recession, followed successively by the 1953-54 recession, the 1957-58 recession, and finally the one in 1960-61, all of which occurred during the years Eisenhower was in the White House. Of course, none of these four postwar economic contractions was comparable either in duration or magnitude to the Great Depression of the 1930's which lasted the twelve years from 1929 until we entered World War II in 1941. This depression is "ancient history" for the youngsters of this generation and mainly forgotten by most members of my generation.

One measure of the extent of a depression is the amount of unemployment. At the bottom of the Great Depression in 1933 more than 25 percent of the nation's total labor force was involuntarily unemployed -- 13 million out of a total labor force of about 50 million, or the shocking ratio of one out of every four people who were willing and able to work. It also should be noted that economists make a distinction between voluntary and involuntary unemployment. Voluntary unemployment exists when people are not willing to work at the going wage rates. For example, if a housewife will not accept an outside secretarial job for any wage less than $5 an hour when the going wage rate is $2 an hour, she is voluntarily unemployed. But, involuntary unemployment exists if people who are able and willing to work at the prevailing wage rates cannot find jobs. As I have already indicated, in 1933 more than 25 percent of the nation's labor force was involuntarily unemployed. This provides us with some perspective when economists and politicans today quibble about whether the present unemployment rate if 4.1 percent or 3.9 percent. In contrast to the current low overall unemployment rate, throughout the 12 years of the Great Depression there was never a single year in which the average unemployment rate was less than 14 percent notwithstanding the heroic efforts of President Roosevelt and his New Deal agencies -- AAA, NRA, WPA, PWA, CCC, etc. As a matter of fact, it was not until 1940 that the Gross National Product regained the pre-depression level achieved in 1929.

In brief, the Great Depression gave rise to what may be designated as "mass poverty." I want to make a distinction between mass and class poverty. What we had in the United States in the 1930's was mass poverty. Unemployment was not restricted to a particular group of people. A large segment of the population was unemployed and living in poverty even though they previously had been conscientiously and gainfully employed in productive activities. Unemployment was general throughout all strata of the labor force, from top to bottom -- professional people, businessmen, skilled craftsmen, as well as semi-skilled and unskilled laborers. Thus, individuals from all walks of life, regardless of experience and education, suddenly found themselves thrown out of work -- involuntarily unemployed. It was under these conditions of mass poverty in the early 1930's that President Roosevelt conservatively estimated that "one third of the nation was ill-fed, ill-housed, and ill-clothed."

Of course, the performance of the economy during World War II was unique, so let us review the four post-war recessions I mentioned earlier. Instead of ranging between 14 and 25 percent, the unemployment rates at the bottom of these contractions never exceeded 7 percent. Under Truman in 1949, unemployment hit 5.9 percent and that was considered high. Under Eisenhower in 1954, unemployment was 5.6 percent, but in 1958 it reached 6.8 percent. In 1961, when President Kennedy took office, the employment rate for the first quarter was still at 6.7 percent. Although as percentages these unemployment statistics may not appear impressive, when converted or translated into human beings they become significant. When we speak of a 7 percent unemployment rate, it represents almost 6 million people. Multiply this figure by the number of dependents attached to each unemployed person, on the average almost three, and we have some idea of the magnitude of the number of additional persons affected -- about 15 million.
